User’s Manual
Line Scan Camera
Type: XCM6040SAT4

NIPPON ELECTRO-SENSORY DEVICES CORPORATION
For Customers in U.S.A.

This equipment has been tested and found to comply with the limits for a Class A digital device, in accordance with Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case the user will be required to correct the interference at his or her own expense.

For Customers in the EU

This equipment has been tested and found to comply with the essential requirements of the EMC Directive 2004/108/EC, based on the following specifications applied:

EU Harmonized Standards
EN55011:2007+A2:2007 Group1 Class A
EN61000-6-2:2005

*Group 1 contains all ISM (Industrial, Scientific and medical) equipment in which there is intentionally generated and/or used conductively coupled radio-frequency energy which is necessary for the internal functioning of the Equipment itself.

*Class A equipment is equipment suitable for use in all establishments other than domestic and those directly connected to a low voltage power supply network which supplies buildings used for domestic purposes.
Introduction

Thank you for purchasing NED’s XCM80 Line Scan Camera. We look forward to your continued custom in the future.

For safety use

◆ For your protection, please read these safety instructions completely before operating the product and keep this manual for future reference.
◆ The following symbols appear next to important information regarding safe product handling.

<table>
<thead>
<tr>
<th>Warning</th>
</tr>
</thead>
<tbody>
<tr>
<td>If the product is not handled properly, this may result in serious injury or possible death.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Caution</th>
</tr>
</thead>
<tbody>
<tr>
<td>If the product is not handled properly, this may result in physical injury or cause property damage.</td>
</tr>
</tbody>
</table>

Safety precaution

Warning

◆ Never disassemble or modify this product, unless otherwise specified to do so in this manual.
◆ When hands are wet, avoid handling this product and do not touch any of the connection cable pins or other metallic components.
◆ Do not operate this product in an environment that is exposed to rain or other severe external elements, hazardous gases or chemicals.
◆ If the product is not to be used for an extended period of time, as a safety precaution, always unplug the connection cable from the camera unit.
◆ If the product installation or inspection must be executed in an overhead location, please take the necessary measures to prevent the camera unit and its components from accidentally falling to the ground.
◆ If smoke, an abnormal odor or strange noise is emitted from the camera unit, first turn OFF power, then unplug the cable from the camera unit.
◆ This product is not intended for use in a system configuration built for critical applications.
Instructions before use

◆ Only operate this product within the recommended environmental temperature range.
◆ Use only the specified power source and voltage rating.
◆ Do not drop this product. Avoid exposure to strong impact and vibrations.
◆ Install the camera unit in a well-ventilated environment, in order to prevent the camera from overheating.
◆ If the camera must be installed in an environment containing dust or other particles, take required measures to protect the camera unit from dust adhesion.
◆ Do not unplug the cable while power is being supplied to the camera unit. To prevent product damage, always shut down the power supply before unplugging the power cable.
◆ When the surface of the camera window becomes dirty due to dust or grime, black smudges appear in the displayed image. Use an air blower to remove the dust particles. Dip a cotton swab into ethanol alcohol and clean the camera window. Be careful not to scratch the glass.
◆ Use of non-infrared lighting such as a daylight fluorescent lamp is recommended. If halogen lighting is employed, always install an infrared filter into your system configuration.
◆ Please note that exposure to long wavelength light outside of the sensors visible optical range can affect the image.
◆ Sensitivity may fluctuate depending on the spectral response level of the light source. In cases like this, changing the light source to one with a different spectral response level may reduce this problem.
◆ For stabilized image capturing, turn ON the power supply and execute aging for ten to twenty minutes before actually using the camera unit.
◆ Do not share the power supply with motor units or other devices that generate noise interference.
◆ Do not disconnect the camera while rewriting an embedded memory.
◆ When you change exposure mode that is set at NED factory, input control signal (CC1) from the capture board.
Exclusion Clause

◆ The manufacturer assumes no responsibility for damages resulting from natural disasters, earthquakes, or acts executed by a third party. Warranty excludes any accidents resulting from improper handling or misuse of this product, whether intentional or not, and any camera operations conducted under abnormal conditions.

◆ The manufacturer assumes no responsibility for any incidental damages (loss of corporate profits, interruption of business, etc.) resulting from use or non-use of this product.

◆ The manufacturer assumes no responsibility for damages resulting from failure to follow the instructions and procedures indicated in this User's Manual.

◆ The manufacturer assumes no responsibility for any damages resulting from malfunctions caused by combined use of this product with other peripheral equipment.

◆ The manufacturer assumes no responsibility for damages resulting from malfunctions caused by non-authorized repair or modifications made to this product.

1 Product Outline

1.1 Features (XCM6040SAT4)

- Wide dynamic range (more than 106dB)
- High speed readout (160MHz)
- High resolution (6144 pixels)
- On-chip AD (8or10) conversion
- Easy control of gain / offset / video output (8/10bit) with a software outside the camera.
- Easy connection with a variety of frame grabber boards via Camera Link interface
- Single power source DC12V to 15 for operation
- Flat-field correction – minimizes lens vignetting, non-uniform lighting and sensor FPN and PRNU

1.2 Application

- Inspection of Transparent panels and PCBs
  - Wide dynamic range prevents saturation caused by direct rays and specular reflection rays.
  - High speed inspection is possible because of the cameras high data output speed.
  - Using random access reading, High speed inspection becomes possible because only the required data is being transferred.
- Inspection of high speed moving objects
- Flat panel display inspection
- Inspection of glass and sheet-like objects
- Printed circuit board inspection
- This camera utilizes an Intelligent Transportation System
- Outdoor surveillance
An example of Visual Inspection of PCBs is shown below.

![Visual Inspection of PCBs](image)

**Figure 1-2-1  Visual Inspection of PCBs**

**Applicable Work**

COB, BGA and MCM printed circuit boards

**Performance**

1. Maximum board size: 100mm×200mm
2. Resolution: 10µm
3. Inspection time: less than 30 seconds

**Unit Configuration**

1. Camera: Line scan camera (6144pixels)
2. Controller: Dedicated software for PC system
3. Size: L930 x D500 x H500 (mm)

**Applicable Fields**

Inspection of patterns on film PCBs
1.3 Image Sensor

The camera adopts a CMOS sensor with the maximum data rate of 160MHz to acquire high responsibility and superior quality images. A pixel size is 7µm x 7µm each.
6040SAT4 outputs 6144pixel data through 40MHz-4Tap.

1.4 Performance Specifications

The Performance Specifications are shown below. Unless otherwise specified, it shows the data when the camera works at a scan rate.

*1) Confirmed under the following conditions.

i Camera Link Cable :14B26-SZLB-A00-0LC by 3M (Full Configuration 10m)

ii Frame Grabber Board : Matrox : SOL 6M FC (Solios : Medium Configuration compatible),
or GRAPHIN :IPM-8531CL-M and IPM-8531CL-F

*2) DN : Digital Number (10bit : 0 -1023)

*3) This product is designed and manufactured in accordance with the following standards.

EN 61000-6-2:2005

FCC Part 15 Subpart B:2006 Class A

*4) Measurements were made at room temperature.

The spectral Responsivity is shown below.

(Ta=25℃)
Figure 1-4-1 Spectral Responsivity
2 Camera Setting and Optical Interface

2.1 Setting Camera
Use the M4 screw holes or the screw hole for a tripod to set the camera. The optional mounting base (sold separately) is available.

2.2 Fixing Camera
- Use the M4 screw holes (4 places at front, 8 places at side) to set the camera.
- Or use the 1/4"-20UNC screw hole for a tripod (1 place at bottom).

- If using the front panel M4 mounting holes, the screw length for fixing the camera at the front should be less than 8mm, and less than 6mm for the side.
- No X-, Y-axis orientation and tilt adjustment mechanism is available. Please prepare an adjustment mechanism as necessary.
The dimensions for Nikon F mount cameras are shown below.

![Diagram of Nikon F Mount](image)

**Figure 2-2-1 Dimensions (Nikon F Mount)**
2.3 Optical Interface

Lens mounts is Nikon F mount.

The amount and wavelengths of light required to capture useful images depend on the intended use. Factors include the property, speed, the objects spectral characteristics, exposure time, the light source characteristics, the specifications of the acquisition system and so on.

The exposure amount (exposure time x light amount) is the most important factor in getting desirable images. Please determine the exposure amount after studying what is most important to your system.

Keep these guidelines in mind when setting up your light source:

- LED light sources are relatively inexpensive, provide a uniform field and longer life span compared to other light sources. However, they also require a camera with excellent sensitivity.
- Halogen light sources generally provide very little blue relative to infrared light (IR).
- Fiber-optic light distribution systems generally transmit very little blue light relative to IR.
- Metal halide light sources are very bright but have a shorter life span compared to other light sources.

Generally speaking, the brighter light sources, the shorter life span.

CMOS image sensors are sensitive to infrared (IR). We recommend using daylight color fluorescent lamps that have low IR emissions. If you use a halogen light source, to prevent infrared from distorting the images use an IR cutoff filter that does not transmit wavelengths.

3 Hardware

3.1 Camera Connection

(1) Camera Link cables shall be used to connect the camera unit with the frame grabber board.
- Use two cables of the same length and the same manufacturer. If you use asymmetric Camera Link cables, connect the camera with the connector labeled as “Camera side”.

(2) Connect with a power supply.

Use a power cable to connect the camera with the power source for the camera. Insert the plug end of the cable into the camera. Attach the opposite end (loose wires) to the power unit.

- Other than those above, a personal computer, a frame grabber board, a taking lens, a lens mount, a light source and an encoder are necessary, depending on the situation.

![Diagram of Camera Link connections](image)

**Figure 3-1-1 Connections between Camera and Frame Grabber Board and Power Supply**

- There are two connectors available for the Camera Link Medium Configuration board. Always check the frame grabber board specifications before making connections.
3.2 Input / Output Connectors and Indicator

The layout of input/output connectors and an indicator are as follows.

![Input/Output Connectors and Indicator Diagram]

Figure 3-2-1 Input/Output Connectors and Indicator
3.3 Connectors • Pin Assignments • Cables

This camera adopts Medium Configuration of Camera Link interface standards. The figure shown below shows the interface for the camera and a typical implementation for the frame grabber interface.

![Camera / Frame Grabber Interface Diagram]

*Figure 3-3-1 Camera / Frame Grabber Interface*
◆ Set the LVDS, Channel Link receiver side to 100 ohm termination.
◆ With the driver side of LVDS, even if not used, do not make it open but set the logic to H or L.

![Figure 3-3-2 Circuit of LVDS](image)

The camera has 26-pin MDR connectors for control signals of Camera Link, data signals and serial communications. The camera also has a 4-pin HIROSE connector for power supply.

**Explanation of Signals**

- **Inner Shield**: Shield cable (GND)
- **X0+,X0-...X3+,X3-**: Data output (Channel Link)
- **Xclk+,Xclk-**: Clock output for above data output synchronization (Channel Link)
- **Y0+,Y0-...Y3+,Y3-**: Data output (Channel Link)
- **Yclk+,Yclk-**: Clock output for above data output synchronization (Channel Link)
- **SerTC+,SerTC-**: Serial data input (LVDS)
- **SerTFG+,SerTFG-**: Serial data output (LVDS)
- **CC1+,CC1-**: External synchronous signal input (LVDS)
- **CC2+,CC2-**: Not in use (LVDS)
- **CC3+,CC3-**: Not in use (LVDS)
- **CC4+,CC4-**: Not in use (LVDS)

**Camera Link compatible cable**

- 3M :14B26 – SZLB – xxx - 0LC by or equivalent

- To avoid uncoupling of cable connectors during power on, make sure to clamp them with locking screws.
- Do not unplug the cable while power is being supplied to the camera.
The pin assignment of the power supply connector is shown below.

### Table 3-3-2 Pin Assignment of Power Supply Connector

#### 3.4 Power Supply

The camera requires a single power supply (DC+12 to +15V).
- When selecting a power source, choose one with extra capacity to allow for in-rush current. (15W or more recommended)
- Insert the cable plug securely until it locks into position. This is to prevent the connector from becoming loose during power transmission.

- Acceptable Cable (Acceptable plug): DGPS -10 (HIROSE : HR10A -7P - 4S)
- Power supply voltage: DC+12 -15V (+/-5%)
- Consumption Current (rated): DC+12V : 500mA

- LED lamp illuminates when +12V to +15V power is being supplied to the camera.
- If the lamp fails to illuminate even after power is supplied, turn OFF power immediately. Inspect wiring. Check the voltage and capacity of the supplied power source.
4 Camera Control

The camera can be controlled through the serial communication. Two methods can be used to change the camera’s parameters. The first approach is to change parameters using CLISBeeCtrl (Camera control software). (See “8 CLISBeeCtrl”.) Or you can also change the parameters directly from your application by using binary read/write commands to set values in the camera register.

The camera can be used without the serial interface after it has been set up correctly.

4.1 Flow of Camera Control

4.1.1 Command Overview

The serial interface uses a simple ASCII-based command.

- Communication begins when the computer sends control commands to the camera.
- The camera receives and interprets the computer commands and then executes control operation accordingly.
- Transmission ends when the camera returns the analyzed results of control commands to the computer.
- Always allow the previous transmission to end before starting the next transmission. (Only one command can be sent per transmission.)

4.1.2 Camera Receiving Message (PC Sending Command)

- Format 1  CMD CR
- Format 2  CMD □ VAL1 CR
- Format 3  CMD □ VAL1 □ VAL2 CR

CMD:  Control text (3 Bytes) Use 3 lowercase letters only. No numerals allowed.
CR:  Carriage Return (0x0D)
□:  Space (0x20) or Comma (0x2C)
VAL:  Setting value (decimal, maximum 5 digits)

<Example>

gax;0 CR
4.1.3 Camera Sending Message (PC Receiving Message)

- Format 1: \( >\text{R} \text{ CR} >[\text{SB}] \text{ CR EOT} \)
- Format 2 (for "sta" command): \( >\text{OK} \text{ CR} >[\text{MEM}] \text{ CR} >\text{sta} \text{ CR EOT} \)

> : Results start text (0×3E)
R: Camera receive command analyzed results
[SB] : Camera receive command send back
[MEM] : Memory data readout value
CR: Separated text (0×0D)
EOT: Send command all text End text (0×04)

<Example>

\( >\text{OK} \text{ CR} >\text{gax} 0 \text{ CR EOT} \)

4.2 Details on Commands

4.2.1 Setting Analog Gain

Sets analog gain in 21 steps between x1 and x11.2. (See Table 4-9)

- Format 2 CMD VAL1 CR
- CMD gax
- VAL 0 (x1) –20 (x11.2)

<Example>

gax5 CR (Setting analog gain 5(x1.84))

>OK
>gax 5

4.2.2 Setting Digital Gain

Sets digital gain in 512 steps between x1 and x2.
4.2.3 Setting Digital Offset
Sets digital offset -15 to +15 (8bit: 1DN/Step), -60 to +60 (10bit: 4DN/step)

<table>
<thead>
<tr>

<Example>
```
inm□0 CR (Setting the exposure mode free run)
>OK
>inm 0
```
CMD int

VAL1  0 -11 (Setting Dividing)

VAL2  0 -1023 (Setting Counter value)

<Example>

int□0□120 CR (Setting exposure time 96µs: in case of 8040SA)

>OK

>int 0,120

4.2.6 Setting Output Signals 1 (Setting Data Format)
Sets the data format of output signals.

- Format 3 CMD□VAL1□VAL2 CR
- CMD voa
- VAL1  0,1 (0: 8bit /1: 10bit)
- VAL2  0-9 (Selecting output block)

<Example>

voa□0□0 CR (8bit /8k pixel output)

>OK

>voa 0,0

4.2.7 Setting Output Signals 2 (Setting Linear / Log)
Sets the data format of output signals.

- Format 2 CMD□VAL1 CR
- CMD voc
- VAL  0,1 (0:linear output / 1:log output)

<Example>

voc□0 CR (linear output)

>OK

>voc 0

4.2.8 Memory Initializing (Initializing Camera Settings)
Reset the flash memory the factory default.

- Format 1 CMD CR
- CMD rst
<Example>
  rst CR
  >OK
  >Type=XCM6040SAT4
  >Ver.=2.06_0x4063
  >Serial=0
  >check_code = 20070615
  >gax 0
  >gdx 0
  >odx 0
  >inm 0
  >int 0,61
  >cka 0
  >voa 0,0
  >voc 0
  >tpn 0
  >shc 1,600
  >pad 0
  >rev 0
  >rst

4.2.9 Memory Load
Reads out the camera settings from the flash memory.
  • Format 1       CMD CR
  • CMD            rfd
<Example>
  rfd CR
  >OK
  >Type=XCM6040SAT4
  >Ver.=2.06_0x4063
  >Serial=0
  >check_code = 20070615
  >gax 0
  >gdx 0
  >odx 0
  >inm 0
>int 0,61
>cka 0
>voa 0,0
>voc 0
>tpn 0
>shc 1,600
>pad 0
>rev 0
>rfd

4.2.10 Memory Save
Stores current camera settings in the flash memory.
- Format 1  CMD CR
- CMD  sav

Example>
sav CR
>OK
>sav

4.2.11 Generating Test Pattern
Generates test pattern.
- Format 2  CMD VAL1 CR
- CMD  tpn
- VAL  0,1 (0:Image data, 1: Test pattern)

Example>

tpn □1 CR (Generating test pattern)
>OK
>tpn 1

4.2.12 Saving Pixel Correction Data
Acquires current pixel correction data and save it in the flash memory. One correction data can be saved at each step of analog gain.
- Format 1  CMD CR
- CMD  wht
4.2.13 Setting Pixel Correction

Sets pixel correction.

- Format 3  
  CMD□VAL1□VAL2 CR
- CMD  
  shc
- VAL1  
  0,1,2 (0:Correction OFF /1:Factory white correction /2:Arbitrary white correction, Correction level (10bit))
- VAL2  
  0-1023 (Setting correction level:10bit)

<Example>
  shc□1□600 CR (for Factory white correction, Correction level 900DN(10bit))
  >OK
  >shc 1,900

4.2.14 Setting Exposure Time - Readout Time

Prolongs the line period without changing the exposure time.

- Format 2  
  CMD□VAL1 CR
- CMD  
  pad
- VAL1  
  0 -50 (0–61440µs)

<Example>
  pad□10 CR
  >OK
  >pad 10

The increment of the line period depends on the exposure time setting command “int”. For XCM8060SA, if VAL1 (in “int”)=0 and VAL1 (in “pad”)=1, the increment is 16.7nsx2x16x2=1.07µs. If VAL1 (in “int”) = 3 and VAL1 (in “pad”)=1, the increment is 16.7nsx2x16x(2x2x2)=4.27µs. For XCM8040SA or XCM6040SA, change upper 16.7ns into 25ns or 18.8ns each.
4.2.15 Returning the Current Camera Settings

Returns the current camera settings.

- Format 1  
  CMD CR
- CMD sta

Example:

sta CR
>OK
>Type=XCM8040SA
>Ver.=2.06_0x4063
>Serial=0
>check_code = 20070615
>gax 0
>gdx 0
>odx 0
>inm 0
>int 0,61
>cka 0
>voa 0,0
>voc 0
>tpn 0
>shc 1,600
>pad 0
>rev 0
>sta

4.2.16 Setting Pixel Readout Direction

Sets the pixel readout direction.

- Format 2  
  CMD□VAL1 CR
- CMD : rev
- VAL1 : 0,1 (0:Forward, 1:Reverse)

Example:

rev□1 CR (Reverse)
>OK
>rev 1
4.3 Digital Processing Flow in FPGA

The figure below shows the digital processing flow in FPGA.

**FPGA Processing block diagram**

In Test Pattern mode, Black / White reference and Digital Gain / Offset will be skipped.

**Figure 4-3-1 FPGA Processing Block Diagram**

4.4 Startup

After turning on, the camera run a startup procedure before it starts getting images and outputting data. It takes about four seconds.

The startup procedure is as follows.

1. The camera initializes the hardware.
2. Reads out the latest camera settings from the flash memory. (User settings if any or factory default settings)
3. Set up the camera with the setting value from the flash memory.

After those sequences, the camera is ready to get images and output data.

4.5 Saving and Loading Camera Settings

The data of camera settings is saved in the internal memory (flash memory) and is loaded from the memory when turning on the power supply or loading (sending the “rfd” command).

- The number of times the flash memory can be rewritten will vary depending on actual operational conditions. After turning on the power supply,
the camera always checks the memory status. If the data is not within the
designated range due to a malfunction or other type of trouble, the memory
will be automatically rewritten into factory settings.
◆ If disconnecting camera power while rewriting the memory, the whole
data saved in the memory will be deleted.
As it takes several seconds for rewriting the memory, do not disconnect
power supply before receiving the answer from the camera.
Commands for rewriting memory are as follows.
- Reset to factory settings (rst)
- Store present setup data in memory (sav)
- Store pixel correction data in memory (wht)
◆ When changing the factory setting exposure mode, be sure to send the
control input signal (CC1) for the frame grabber board. If you do not send CC1
or sending control input signals are out of the designated range, you cannot
get images and can not change the setting. See 4.8.2 and 4.8.3.

<table>

### 4.7 Video Output Format

The camera outputs 8-bit or 10-bit digital data through 4 taps.

- **The A/D converter of the camera has a 10-bit resolution. For 8-bit output, the upper 8-bit signal can be output as a video data.**
Video output phase of 6040SAT4 is shown below.

◆ FVAL = 0 (low level) fixed

Figure 4-7-2 Video Output Phase of XCM6040SAT4
4.8 Exposure Mode and Timing Chart
The camera has three exposure modes. The overview of each mode and the timing are as follows.

4.8.1 Free Run Exposure Mode (Programming time setting)
In free-run exposure mode, the camera generates its own internal control signal based on two programmable parameters, exposure time and readout time.

Table 4-8-1-1 Programmable Exposure Time

<table>
<thead>
<tr>
<th></th>
<th>XCM6040SAT4</th>

</tr>
<tr>
<td>r</td>
<td>Readout time</td>
</tr>
</tbody>
</table>

![Figure 4-8-1-1 Free Run Exposure Mode]

- The data of Exposure (1) is read out at Readout (1)
4.8.2 External Trigger Exposure Mode (Trigger Edge)

In external trigger exposure mode (Trigger Edge), the exposure time is determined by the setting for the line period parameter, each exposure starts with the rising edge and the line period is determined by the time from rising edge to rising edge of the internal control signal. The range of programmable exposure time is shown in Table 4-8-2-1 and the timing chart of the exposure and the readout are shown in Figure 4-8-2-1.

Table 4-8-2-1 Programmable Exposure Time

<td>≧ 40.2</td>
</tr>
</tbody>
</table>

Figure 4-8-2-1 External Trigger (Trigger Edge) Exposure Mode

◆ The data of Exposure (1) is read out at Readout (1)
4.8.3 External Trigger Exposure Mode (Trigger Level)

In external trigger exposure mode (Trigger Level), the exposure time is determined by the setting for the line period parameter, each exposure starts with the rising edge and the line period is determined by high trigger pulse time. The range of programmable exposure time is shown in Table 4-8-3-1 and the timing chart of the exposure and the readout are shown in Figure 4-8-3-1.

Table 4-8-3-1 Programmable Exposure Time

<td>$\geq 40.2$</td>
</tr>
</tbody>
</table>

Figure 4-8-3-1 External Trigger (Trigger Level) Exposure Mode

- The data of Exposure (1) is read out at Readout (1)
4.9 Setting Offset

In the figure below, the horizontal axis indicates the amount of incident and vertical axis indicates the output.

Fs shows the output at saturation. Dd shows the output at darkness. (Both Fs and Dd are digital.) Se shows for the saturation current, or the amount of exposure when the output saturates.

![Figure 4-9-1 Saturation Exposure and Dark Current Output](image)

By setting the offset, you can set the Y-intercept arbitrarily. DF shows the digital offset value. The slopes of lines do not change.

![Figure 4-9-2 Offset Adjustment](image)

- Adjust amount of offset in accordance with the requirements of your camera system.
4.10 Setting Gain

The camera can adjust the analog gain (x1 to X11.2 in 21 steps) and the digital gain. As shown in the figure below, increasing the gain setting increases the slope of the camera’s response curve and results in a higher camera output for a given amount of light. Analog gain can be changed by sending the “gax” command. Digital gain can be changed by sending the “gdx” command.

![Figure 4-10-1 PGA Gain Adjustment](image)

- Gain and noise values are proportionally related.
- Adjust amount of gain in accordance with the requirements of your camera system.
Gain-Sensitivity is shown below.

</tbody>
</table>

Digital gain x1, Pixel correction: default, (Factory white correction data, Correction level 600DN)

You can choose A/D Characteristics of the camera’s output by sending the “voc” command, Linear mode or Log mode. The characteristics are shown in Figure 4-10-2.
4.11 Pixel Correction

Generally speaking, image sensors (CCD, CMOS and so on) have fixed pattern noise and photo response non-uniformity. Lens shadings and light sources also can cause non-uniformity. The camera is set to the optimal correction before shipping in order to provide images of high grade.

The camera also has the function of user white correction to cope with lens shading and non-uniform illumination, or to be able to completely clear the uneven brightness generated by changing spectral response level of the light source. Cal_bl: Output data of each pixel at perfectly dark (digital) Cal_wh: Output data of each pixel in uniform illumination (digital) Target_Val : Target value for correction (10bit digital) Vin :Input data (digital) Vout :Output data (digital) The corrected data is expressed in the following equation. 

\[ V_{\text{out}} = \left( V_{\text{in}} - V_{\text{cal, bl}} \right) \times \text{Target_val} / \left( V_{\text{cal, wh}} - V_{\text{cal, bl}} \right) \]

![Waveform before bit correction](image)

![Waveform after bit correction](image)

*Figure 4-11-1 Waveform before and after bit correction*
4.11.1 Command Settings

Set the correction on or off, acquire arbitrary white correction data by sending commands through serial communication,

The example of command settings

- shc 0,900: No correction
- shc 1,900: Factory white correction
- shc 2,900: Arbitrary white correction
- wht: Acquisition of arbitrary white correction data

4.11.2 How to correct

1. Remove the lens cap and set a white object. Then you can acquire arbitrary white correction data. With a lens, the shading by both a lens and a light source will be simultaneously corrected. At this time, please defocus a little to avoid being affected by the un-uniformity of the object.

2. Send the “wht” command through serial communication.

3. Confirm that the camera returns “>OK” and “>wht”. Thus arbitrary white correction data is saved and loaded to the camera.

4. Send the “shc 2 VAL2” command through serial communication. Then the arbitrary white correction will be on and set the correction level as “VAL2”.
4.12 Test Pattern

The test pattern of XCM6040SAT4 is as follows.

Figure 4-12-1 Test Pattern of XCM6040SA

Figure 4-12-2 Test Image of XCM6040SA

The test pattern is a ramp from 0 to 1023DN, and then from 0 to 511DN in 10-bit mode, then starts 0 again.
5 Confirming Camera Settings

5.1 Before Power-on

(1) Confirm the pin assignment of the power cable.

<table>
<thead>
<tr>
<th>No</th>
<th>NAME</th>
<th>Color of Cable</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>12-15V</td>
<td>White</td>
</tr>
<tr>
<td>2</td>
<td>12-15V</td>
<td>Red</td>
</tr>
<tr>
<td>3</td>
<td>GND</td>
<td>Green</td>
</tr>
<tr>
<td>4</td>
<td>GND</td>
<td>Black</td>
</tr>
</tbody>
</table>

Figure 5-1-1 Pin Assignment of Power Cable

(2) Confirm the direction and the channel of the cables. Some Camera Link cables are directional. If one of the connectors says “Camera side”, connect this to the camera.

Figure 5-1-2 Connection Direction of Camera Cable
The connection channel of in case of “Solios”

CL1 = CHANNEL #0
CL2 = CHANNEL #1

5.2 After Power-on

(1) Confirm sent and received commands using the camera control utility. Launch CLISBeeCtrl, set COM port and connect. Click “Memory Dump” and wait for the response.
(2) Set a trigger mode and a video output mode with the camera control utility.

- Trigger mode = Free run
- Video output mode = 8bit

![Figure 5-2-2 Exposure Mode, Video Output Mode Setting](image)

- If you have your own application to check the images, select suitable settings.
(3) Capture images using a camera interface board utility. In case of Matrox's Solios, it is convenient to use Intellicam.

![Figure 5-2-3 Solios Window](image-url)
5.3 In Operation

(1) Does acquisition time out error occur?

<Cause>

<1> Captured images are too heavy.
If there are many filtering processes, the assignments to the driver may be insufficient.

<2> The cable detachment from the connector
Ensure that the power cable and Camera Link cables are connected to the camera surely

<3> Camera Link cables come under the influence of noises when the cables are laid near a light source inverter line or a power line. The personal computer in use may be reset.

(2) Are there dark lines in the direction of vertical scanning on the image?

<Cause>

<1> Dust on the sensor window
Dust may come on the sensor window from the inside or the outside of the camera. Remove the dust with air or a lens cleaner.
6 Sensor Handling Instructions

6.1 Electrostatic Discharge and the Sensor
CMOS sensors are susceptible to damage from electrostatic discharge and can deteriorate

6.2 Protecting Against Dust, Oil and Scratches
The CMOS sensor window is part of the optical path and should be handled like other optical components with care. If you use the camera in a dusty area, prepare a dust-proof enclosure. Dust can obscure pixels, producing dark lines on the image.

6.3 Cleaning the Sensor Window
Dust: Can usually be removed by blowing the window surface using a compressed air blower.
Oil: Wipe the window with a lint-free cloth wiper moistened with ethyl alcohol carefully and slowly.

When there is dust or smudges on the sensor window, it appears in the same way as noise on the image. Please remove it appropriately.
7 Troubleshooting

The following pages contain several troubleshooting charts that can help you find the cause of problems user sometimes encounter.

7.1 No Image

The indicator is glowing.  
Yes  
No

The camera has the correct connections with the power source and the frame grabber.  
Yes  
No

The power source meets the specified voltage.  
Yes  
No

After energization, the power source meets the specified voltage.  
Yes  
No

The camera can be out of order. Please contact us for service.  
Yes  
No

The camera has the correct connection with the frame grabber.  
Yes  
No

The frame grabber board is energized and set up.  
Yes  
No

The frame grabber is communicating with the camera successfully.  
Yes  
No

The sample software program is used to control the camera.  
Yes  
No

The sample software program is used to control the camera and is communicating with the camera successfully.  
Yes  
No

After being energized, set up the frame grabber board suitably.  
Yes  
No

Arrange the power source that meets the specifications.  
Yes  
No

Connect the camera and the frame grabber board with camera cables.  
Yes  
No

To next page A  
To next page B  
Confirm the communication software, the control protocol for the camera and commands.
The capturing software program is custom made.

With the sample software program provided, no image is captured.

The communication port is set correctly.

The amount of the illumination is enough.

Nothing blocks off the light.

The optical axes of the camera and the image sensor are aligned.

Set the communication port correctly.

The camera can be out of order. Please contact us for service.

Check the compatibility between the camera and the frame grabber board.

If a lens cap is on, get it off.

Check the light source. If the images are too dark, try to increase the light intensity, and vice versa.

The camera can be out of order. Please contact us for service.
7.2 Noise on Image

- Noises come out from the beginning.  
  - Yes
  - No

- A servomotor or a magnetic valve is placed near the camera.  
  - Yes
  - No

- Turning on a servomotor or a magnetic valve generates an electric noise.  
  - Yes
  - No

  Prevent the noise source from disturbing the camera cables and the power cable.

- The camera has been used for 3 or more years, or the ambient temperature is higher than room temperature.  
  - Yes
  - No

- There are some consumable parts in the camera. Please contact us for service.

- The power supply has been used for 3 or more years, or the ambient temperature is higher than room temperature.  
  - Yes
  - No

  Check the deterioration of the power supply.

- The camera, the camera cables and the power source cable are in swinging motion.  
  - Yes
  - No

  Check the deterioration of the camera cables and the power supply cable.

- The camera can be out of order. Please contact us for service.

To next page C
Cables are asymmetric such as thin cables.  

One of the connectors of an asymmetric camera cable is to be connected with a camera. (Labeled as “Camera side”)  

The camera cables are too long.  

Use camera cables in accordance with the transmission rate. The cables should not be too long to avoid the noise disturbance.  

The power source has no fluctuation in voltage and is not deteriorated.  

When the camera gain is on a high level, bright spots occur without incident light.  

Secondary radiation (rays) could cause bright spots, but this is not malfunction.  

The camera can be out of order. Please contact us for service.  

Use a stable power supply.
7.3 Camera becomes hot

The consumption current of the power supply is larger than the rating.

Yes

The camera is too hot to touch.

No

Yes

The camera will become hotter than the ambient temperature while in operation because of self-heating. Allow sufficient air circulation around the camera to give it the longer life.

No

Keep the ambient temperature within the range the specifications specify.

Yes

The camera can be out of order. Please contact us for service.
8 CLISBeeCtrl

8.1 Overview
The CLISBeeCtrl is the remote control software for "CLISBee*" camera using "NED Camera Control Protocol" (NCCP) from PC. Connectable interfaces are following.
1) Camera Link API
2) Communication Port (COM port, RS232C)
*CLISBee is the nickname for XCM series camera.

8.2 System Requirements
PC : PC/AT compatible
Operating System: Microsoft Windows 2000 or XP. (Windows Vista: not confirmed)
Free disk space: 1-2MB (It may fluctuate with the number of camera parameter files.)
Connection: Camera Link grabber board, Camera Link cables

8.3 Install
Copy the CLISBeeCtrl folder in the media (CD-ROM, etc) which our company provides, to your hard disk.

8.4 Uninstall
Remove the CLISBeeCtrl folder and all files in CLISBeeCtrl folder.
8.5 Operation

8.5.1 Start Program

Open Windows Explorer and Double-click the "CLISBeeCtrl.exe".

Buttons in the tool-bar have the following functions.

A: Exporting parameters in the text file format.
B: Connection with the camera.
C: Disconnection.
D: Setting Communication.
E: Version Information.
8.5.2 Selecting interface and Timeout setting

8.5.2.1.Selecting interface

1) Click button D.

![Communication Settings window]

2) Select the interface in Drop-down-list-box.

![Communication Settings window]

3) Click “Setting” button to set the interface. (See 8.5.2.2. and 8.5.2.3.)

4) Click “OK” button.
   Click “Cancel” button when stopping setup.

   Note: The camera can be used without this operation after it has been set up correctly.
8.5.2.2 Setting Communication port

1) Set up each item as follows. (NED standard)
   However, when the setup which differs to the camera to connect is shown, follow there.

   (1) Port: Select connecting port.
   (2) Bits per Second: 9600
   (3) Data bits: 8
   (4) Parity: None
   (5) Stop bits: 1
   (6) Flow control: None

   Note: Other parameters are not used.

2) Click "OK" button.
   Click "Cancel" button when stopping setup.

   Note: The camera can be used without this operation after it has been set up correctly.
8.5.2.3 Setting Camera Link

1) Input the DLL file name for Camera Link API by edit-box, Or click “Browse” button and select this file.

2) Input value corresponding to the position of Camera Link cable to connect, into “Serial Index” column.

3) Click “OK” button. Click “Cancel” button when stopping setup.

Note: The camera can be used without this operation after it has been set up correctly.
Note: DLL for Camera Link API is provided by the manufacturer of the grabber board. Grabber board connecting to communication port of PC also exists. (DLL is not provided.) In this case, select interface to the communication port (COM port, RS232C). Please contact the manufacturer of the grabber board for detail.
8.5.2.4 Setting Timeout

1) Input each timeout value in the edit-box.(unit :ms) 
   Click "Default" when initialize values in the edit-box.  
   The meanings of each timeout are as follows. 

   First Receive:  The maximum time from sending a command to receiving the first data.  
   Next Receive:  The maximum time between a letter and the next one.  
   Send:  The maximum time until finishing sending a command.  

2) Click "OK" button. 
   Click “Cancel” button when stopping setup.  

   Note: The camera can be used without this operation after it has been set up correctly.
8.5.3. Connect

Click button B, and you can control the camera. (See “8.6. Control”)
Then click “Memory Dump”.

8.5.4. Disconnect and end program

Click button C. Then click “X” button in the upper right of the window.

8.5.5. Check of the contents of communication

Click "Console" tag at the lower of a window.
8.5.6. Export Parameters to text file

1) Click button A.

2) Input file name and click “Save” button. Present setting value of each control is saved by text format.

8.5.7. Import Parameters from text file

1) Select menu “File” – “Text Load”

2) Input file name and click “Open” button.

Each command preserved in the text file is issued one by one.
8.6 Control

8.6.1 Gains and Offsets

< Gain >

**Analog 1 / Analog 2:**
The signal will be sent to the camera every time you choose the menu in the drop-down-list-box.

*Note: XCMx0x0SA does not use ‘Analog 2’. (Included to ‘Analog 1’)*

**Digital:**
Set a value with the slider, the edit-box or the spin-button. Then, click “Send” button.

< Offset >

**Digital:**
Set a value with the slider, the edit-box or the spin-button. Then, click “Send” button.
8.6.2 Clock & Integration

**Clock:**  
Shows the camera internal clock frequency.  
*(Read Only)*

**Dividing / Counter:**  
Setting integration time.  
First, choose a dividing clock from the drop-down-list-box.  
Next, set a counter value with the slider, edit-box or the spin-button. Then, click “Send” button.

**Integration Time:**  
Shows the calculated value of integration time. (unit: µs)

**Padding:**  
Set a value with the slider, the edit-box or the spin-button. Then, click “Send” button.

**Padding Time:**  
Shows the calculated value of padding time. (unit: µs)

**Scanrate:**  
Shows the calculated value of the scan rate. (unit: µs)

**Scanrate -> Counter Calculating:**  
Set the value in the edit-box. Then, click this button.  
Put the desirable scan rate value, then the counter value will be calculated automatically with the present values of clock, dividing and padding.
8.6.3 Trigger & Video

The signal will be sent to the camera every time you choose the menu in the drop-down-list-box.

**Trigger Mode**:

The selection of Free Run Exposure mode and External Trigger Exposure mode.

**Video output**:

The selection of the number of the output bit and the output block.

**ADC Characteristic**:

The selection of the A/D characteristics.

**Direction of scanning**:

The selection of the scan direction.
8.6.4 Intelligence

< Calibration >

Calib White:
Acquisition of white data and saving the calibration data to camera’s flash memory.

Mode / Level:
First, choose the mode from the drop-down-list-box.
Next, set a value with the slider, the edit-box or the spin-button. Then, click “Send” button.

Test Pattern:
The signal will be sent to the camera every time you choose the menu in the drop-down-list-box.
8.6.5 Memory in camera

**Memory Dump**:
Read the data from the camera's work memory.

**Flash Load**:
Loading the data from the camera's flash memory.

**Flash Save**:
Saving the data in the camera's flash memory.

**Flash Initialize**:
Initializing the camera's flash memory with the factory standard data.
8.7 Upgrade

When allowed to carry out offer of the newest software from our company, please perform in the following procedure.

1) Check the CLISBeeCtrl has not started.
2) Uninstall the old version software. (See “8.4.Uninstall”)
3) Install new version software. (See “8.3.Install”)

8.8 How to Program

Please refer sample programs in CLISBeeCtrl¥SampleProgram folder.

8.9 Attention on use

1) Reproducing and distributing without notice the part or all of this software and this book refuses firmly.
2) Reverse engineering, decompiling, disassembling and modifying without notice the part or all of this software refuses firmly.
3) The specification of this software and the contents of this book may be changed without announcement in future.
9 Others

9.1 Notice

- No part of this document may be reproduced in any form, in whole or in part, without the expressed written consent of NED.
- Contents of this document are subject to change without prior notice.
- Every care has been taken in the preparation of this User’s Manual. If you should discover any errors or omissions, please notify your nearest NED representative.

9.3 Product Support

If there is a problem with your camera after checking it in accordance to the troubleshooting, turn off power and call your NED representative.

In that case, please inform us the status of the camera. You can get the status by

(1) executing the “sta” command, or
(2) clicking “Memory Dump” button when using CLISBeeCtrl.

The example of the camera status.
