4.1	Class List	7
5	Module Documentation	9
5.1	SynView Plain C API functions	9
5.1.1	Detailed Description	9
5.2	General purpose functions	10
5.2.1	Detailed Description	10
5.2.2	Function Documentation	10
5.2.2.1	LvCloseLibrary()	10
5.2.2.2	LvGetErrorMessage(LvStatus Error, char *pMessage, size_t Size)	10
5.2.2.3	LvGetLastErrorMessage(char *pMessage, size_t Size)	10
5.2.2.4	LvGetLibInfo(LvEnum Info, int32_t *pInfo, int32_t Param)	12
5.2.2.5	LvGetLibInfoStr(LvEnum Info, char *pInfoStr, size_t Size, int32_t Param)	12
5.2.2.6	LvGetLibInfoStrSize(LvEnum Info, size_t *pSize, int32_t Param)	12
5.2.2.7	LvGetVersion()	12
5.2.2.8	LvLog(const char *pLogMessage)	13
5.2.2.9	LvOpenLibrary()	13
5.3	System module functions	14
5.3.1	Detailed Description	14
5.3.2	Function Documentation	14
5.3.2.1	LvGetNumberOfSystems(uint32_t *pNumberOfSystems)	14
5.3.2.2	LvGetSystemId(uint32_t Index, char *pSystemId, size_t Size)	14
5.3.2.3	LvGetSystemIdSize(uint32_t Index, size_t *pSize)	14
5.3.2.4	LvSystemClose(LvHSystem *phSystem)	15
5.3.2.5	LvSystemFindInterface(LvHSystem hSystem, LvEnum FindBy, const char *pFindStr, char *pInterfaceId, size_t Size)	15
5.3.2.6	LvSystemGetInterfaceId(LvHSystem hSystem, uint32_t Index, char *pInterfaceId, size_t Size)	15
5.3.2.7	LvSystemGetInterfaceIdSize(LvHSystem hSystem, uint32_t Index, size_t *pSize)	16
5.3.2.8	LvSystemGetNumberOfInterfaces(LvHSystem hSystem, uint32_t *pNumberOfInterfaces)	16
5.3.2.9	LvSystemOpen(const char *pSystemId, LvHSystem *phSystem)	16
5.3.2.10	LvSystemUpdateInterfaceList(LvHSystem hSystem, uint32_t Timeout)	17
5.3.2.11	LvUpdateSystemList()	17
5.4	Interface module functions	18
5.4.1	Detailed Description	18
5.4.2	Function Documentation	18
5.4.2.1	LvInterfaceClose(LvHInterface *phInterface)	18

5.4.2.2	LvInterfaceFindDevice(LvHInterface hInterface, LvEnum FindBy, const char *pFindStr, char *pDeviceld, size_t Size)	18
5.4.2.3	LvInterfaceGetDeviceld(LvHInterface hInterface, uint32_t Index, char *pDeviceld, size_t Size)	19
5.4.2.4	LvInterfaceGetDeviceldSize(LvHInterface hInterface, uint32_t Index, size_t *pSize)	19
5.4.2.5	LvInterfaceGetNumberOfDevices(LvHInterface hInterface, uint32_t *pDevices)	19
5.4.2.6	LvInterfaceOpen(LvHSystem hSystem, const char *pInterfaceld, LvHInterface *phInterface)	20
5.4.2.7	LvInterfaceUpdateDeviceList(LvHInterface hInterface, uint32_t Timeout)	20
5.5	Device module functions	21
5.5.1	Detailed Description	21
5.5.2	Function Documentation	21
5.5.2.1	LoadBatch(const char *pFileName)	21
5.5.2.2	LvDeviceAcquisitionAbort(LvHDevice hDevice, uint32_t Options)	21
5.5.2.3	LvDeviceAcquisitionArm(LvHDevice hDevice, uint32_t Options)	22
5.5.2.4	LvDeviceAcquisitionStart(LvHDevice hDevice, uint32_t Options)	22
5.5.2.5	LvDeviceAcquisitionStop(LvHDevice hDevice, uint32_t Options)	22
5.5.2.6	LvDeviceClose(LvHDevice *phDevice)	22
5.5.2.7	LvDeviceGetNumberOfStreams(LvHDevice hDevice, uint32_t *pNumberOfStreams)	23
5.5.2.8	LvDeviceGetStreamId(LvHDevice hDevice, uint32_t Index, char *pStreamId, size_t Size)	23
5.5.2.9	LvDeviceGetStreamIdSize(LvHDevice hDevice, uint32_t Index, size_t *pSize)	23
5.5.2.10	LvDeviceLoadBatch(LvHDevice hDevice, const char *pFileName)	24
5.5.2.11	LvDeviceLoadSettings(LvHDevice hDevice, const char *pId, const char *pFileName, uint32_t Options)	24
5.5.2.12	LvDeviceOpen(LvHInterface hInterface, const char *pDeviceld, LvHDevice *phDevice, LvEnum Access)	24
5.5.2.13	LvDeviceReOpen(LvHInterface hInterface, const char *pDeviceld, LvHDevice *phDevice, LvEnum Access)	25
5.5.2.14	LvDeviceSaveSettings(LvHDevice hDevice, const char *pId, const char *pFileName, uint32_t Options)	25
5.5.2.15	LvDeviceUniGetLut(LvHDevice hDevice, LvEnum Selector, void *pLUT, size_t Size, uint32_t Options)	25
5.5.2.16	LvDeviceUniSetLut(LvHDevice hDevice, LvEnum Selector, void *pLUT, size_t Size, uint32_t Options)	26
5.6	Stream module functions	27
5.6.1	Detailed Description	27
5.6.2	Function Documentation	27
5.6.2.1	LvStreamClose(LvHStream *phStream)	27
5.6.2.2	LvStreamFlushQueue(LvHStream hStream, LvEnum Operation)	27
5.6.2.3	LvStreamGetBufferAt(LvHStream hStream, uint32_t BufferIndex, LvHBuffer *phBuffer)	27
5.6.2.4	LvStreamOpen(LvHDevice hDevice, const char *pStreamId, LvHStream *phStream)	28
5.6.2.5	LvStreamStart(LvHStream hStream, uint32_t StartFlags, uint32_t ImagesToAcquire)	28
5.6.2.6	LvStreamStop(LvHStream hStream, uint32_t StopFlags)	28
5.7	Buffer module functions	29
5.7.1	Detailed Description	29
5.7.2	Function Documentation	29
5.7.2.1	LvBufferAttachProcessBuffer(LvHBuffer hBuffer, void *pDataPointer, size_t DataSize)	29
5.7.2.2	LvBufferClose(LvHBuffer *phBuffer)	29
5.7.2.3	LvBufferGetImgInfo(LvHBuffer hBuffer, LvImgInfo *pImgInfo, uint32_t Options)	30
5.7.2.4	LvBufferGetLastPaintRect(LvHBuffer hBuffer, int32_t *pX, int32_t *pY, int32_t *pWidth, int32_t *pHeight)	30

5.7.2.5	LvBufferOpen(LvHStream hStream, void *pDataPointer, size_t DataSize, void *pUserPointer, uint32_t Options, LvHBuffer *phBuffer)	30
5.7.2.6	LvBufferParseChunkData(LvHBuffer hBuffer, uint32_t UpdateLayout)	31
5.7.2.7	LvBufferQueue(LvHBuffer hBuffer)	32
5.7.2.8	LvBufferSaveImageToBmpFile(LvHBuffer hBuffer, const char *pFileName)	32
5.7.2.9	LvBufferSaveImageToJpgFile(LvHBuffer hBuffer, const char *pFileName, uint32_t Quality)	32
5.7.2.10	LvBufferSaveImageToTifFile(LvHBuffer hBuffer, const char *pFileName, uint32_t Options)	33
5.7.2.11	LvBufferUniCalculateWhiteBalance(LvHBuffer hBuffer)	34
5.8	Event module functions	35
5.8.1	Detailed Description	35
5.8.2	Function Documentation	35
5.8.2.1	LvEventCallbackMustExit(LvHEvent hEvent)	35
5.8.2.2	LvEventClose(LvHEvent *phEvent)	35
5.8.2.3	LvEventFlush(LvHEvent hEvent)	35
5.8.2.4	LvEventGetDataInfo(LvHEvent hEvent, void *pInBuffer, size_t InSize, LvEnum Info, void *pBuffer, size_t *pSize, LvEnum *pType, int32_t Param)	36
5.8.2.5	LvEventKill(LvHEvent hEvent)	36
5.8.2.6	LvEventOpen(LvHModule hModule, LvEnum EventType, LvHEvent *phEvent)	36
5.8.2.7	LvEventPutData(LvHEvent hEvent, void *pBuffer, size_t Size)	37
5.8.2.8	LvEventSetCallback(LvHEvent hEvent, LvEventCallbackFunct pFunction, void *pUserParam)	38
5.8.2.9	LvEventSetCallbackNewBuffer(LvHEvent hEvent, LvEventCallbackNewBufferFunct pFunction, void *pUserParam)	38
5.8.2.10	LvEventStartThread(LvHEvent hEvent)	38
5.8.2.11	LvEventStopThread(LvHEvent hEvent)	39
5.8.2.12	LvEventWaitAndGetData(LvHEvent hEvent, void *pBuffer, size_t *pSize, uint32_t Timeout)	40
5.8.2.13	LvEventWaitAndGetNewBuffer(LvHEvent hEvent, LvHBuffer *phBuffer, uint32_t Timeout)	40
5.9	Renderer module functions	41
5.9.1	Detailed Description	41
5.9.2	Function Documentation	41
5.9.2.1	LvRendererCanDisplayImage(LvHRenderer hRenderer, LvHBuffer hBuffer, uint32_t RenderFlags)	41
5.9.2.2	LvRendererClose(LvHRenderer *phRenderer)	41
5.9.2.3	LvRendererDisplayImage(LvHRenderer hRenderer, LvHBuffer hBuffer, uint32_t RenderFlags)	41
5.9.2.4	LvRendererOpen(LvHStream hStream, LvHRenderer *phRenderer)	42
5.9.2.5	LvRendererRepaint(LvHRenderer hRenderer, uint32_t RenderFlags)	42
5.9.2.6	LvRendererSetWindow(LvHRenderer hRenderer, void *pDisplay, int64_t hWindow)	42
5.9.2.7	LvRendererStart(LvHRenderer *phRenderer)	43
5.9.2.8	LvRendererStop(LvHRenderer *phRenderer)	43
5.10	Feature control functions	44
5.10.1	Detailed Description	45
5.10.2	Function Documentation	45
5.10.2.1	LvCmdExecute(LvHModule hModule, LvFeature Feature, uint32_t Timeout)	45
5.10.2.2	LvCmdIsDone(LvHModule hModule, LvFeature Feature, uint32_t *pIsDone)	46
5.10.2.3	LvGetAccess(LvHModule hModule, LvFeature Feature, LvEnum *pFtrAccess)	47
5.10.2.4	LvGetBool(LvHModule hModule, LvFeature Feature, int32_t *pValue)	47
5.10.2.5	LvGetBuffer(LvHModule hModule, LvFeature Feature, void *pBuffer, size_t Size)	47
5.10.2.6	LvGetBufferSize(LvHModule hModule, LvFeature Feature, size_t *pSize)	48
5.10.2.7	LvGetEnum(LvHModule hModule, LvFeature Feature, LvEnum *pValue)	48
5.10.2.8	LvGetEnumStr(LvHModule hModule, LvFeature Feature, char *pSymbolicName, size_t Size)	48
5.10.2.9	LvGetEnumStrByVal(LvHModule hModule, LvFeature Feature, LvEnum Value, char *pSymbolicName, size_t SymbolicNameSize, LvEnum *pFtrAccess)	49

5.10.2.10 LvGetEnumValByStr(LvHModule hModule, LvFeature Feature, const char *pSymbolicName, LvEnum *pValue, LvEnum *pFtrAccess)	49
5.10.2.11 LvGetFeatureAt(LvHModule hModule, LvEnum FeatureGroup, uint32_t Index, LvFeature *pItem, uint32_t *pLevel)	49
5.10.2.12 LvGetFeatureByName(LvHModule hModule, LvEnum FeatureGroup, const char *pName, LvFeature *pItem)	50
5.10.2.13 LvGetFloat(LvHModule hModule, LvFeature Feature, double *pValue)	50
5.10.2.14 LvGetFloatRange(LvHModule hModule, LvFeature Feature, double *pMinValue, double *pMaxValue, double *pIncrement)	50
5.10.2.15 LvGetInfo(LvHModule hModule, LvFeature Feature, LvEnum FtrInfo, int32_t *pInfo, int32_t Param)	51
5.10.2.16 LvGetInfoStr(LvHModule hModule, LvFeature Feature, LvEnum FtrInfo, char *pInfoStr, size_t Size, int32_t Param)	51
5.10.2.17 LvGetInfoStrSize(LvHModule hModule, LvFeature Feature, LvEnum FtrInfo, size_t *pSize, int32_t Param)	51
5.10.2.18 LvGetInt(LvHModule hModule, LvFeature Feature, int64_t *pValue)	52
5.10.2.19 LvGetInt32(LvHModule hModule, LvFeature Feature, int32_t *pValue)	52
5.10.2.20 LvGetInt32Range(LvHModule hModule, LvFeature Feature, int32_t *pMinValue, int32_t *pMaxValue, int32_t *pIncrement)	52
5.10.2.21 LvGetInt64(LvHModule hModule, LvFeature Feature, int64_t *pValue)	53
5.10.2.22 LvGetInt64Range(LvHModule hModule, LvFeature Feature, int64_t *pMinValue, int64_t *pMaxValue, int64_t *pIncrement)	53
5.10.2.23 LvGetIntRange(LvHModule hModule, LvFeature Feature, int64_t *pMinValue, int64_t *pMaxValue, int64_t *pIncrement)	54
5.10.2.24 LvGetNumFeatures(LvHModule hModule, LvEnum FeatureGroup, uint32_t *pNumItems)	55
5.10.2.25 LvGetPtr(LvHModule hModule, LvFeature Feature, void **ppValue)	55
5.10.2.26 LvGetString(LvHModule hModule, LvFeature Feature, char *pValue, size_t Size)	55
5.10.2.27 LvGetStringSize(LvHModule hModule, LvFeature Feature, size_t *pSize)	56
5.10.2.28 LvGetType(LvHModule hModule, LvFeature Feature, LvEnum *pFtrType, LvEnum *pFtrGui, LvEnum *pFtrGroup)	56
5.10.2.29 LvGetVisibility(LvHModule hModule, LvFeature Feature, LvEnum *pFtrVisibility)	56
5.10.2.30 LvIsAvailable(LvHModule hModule, LvFeature Feature)	57
5.10.2.31 LvIsAvailableByName(LvHModule hModule, LvEnum FeatureGroup, const char *pName)	57
5.10.2.32 LvIsAvailableEnumEntry(LvHModule hModule, LvFeature Feature, LvEnum EnumEntry)	57
5.10.2.33 LvIsImplemented(LvHModule hModule, LvFeature Feature)	58
5.10.2.34 LvIsImplementedByName(LvHModule hModule, LvEnum FeatureGroup, const char *pName)	58
5.10.2.35 LvIsImplementedEnumEntry(LvHModule hModule, LvFeature Feature, LvEnum EnumEntry)	58
5.10.2.36 LvIsReadable(LvHModule hModule, LvFeature Feature)	58
5.10.2.37 LvIsWritable(LvHModule hModule, LvFeature Feature)	59
5.10.2.38 LvPoll(LvHModule hModule)	59
5.10.2.39 LvRegisterFeatureCallback(LvHModule hModule, LvFeature Feature, LvFeatureCallbackFunc pFunction, void *pUserParam, void *pFeatureParam)	59
5.10.2.40 LvSetBool(LvHModule hModule, LvFeature Feature, int32_t Value)	60
5.10.2.41 LvSetBuffer(LvHModule hModule, LvFeature Feature, void *pBuffer, size_t Size)	60
5.10.2.42 LvSetEnum(LvHModule hModule, LvFeature Feature, LvEnum Value)	60
5.10.2.43 LvSetEnumStr(LvHModule hModule, LvFeature Feature, const char *pSymbolicName)	61
5.10.2.44 LvSetFloat(LvHModule hModule, LvFeature Feature, double Value)	61
5.10.2.45 LvSetInt(LvHModule hModule, LvFeature Feature, int64_t Value)	61
5.10.2.46 LvSetInt32(LvHModule hModule, LvFeature Feature, int32_t Value)	62
5.10.2.47 LvSetInt64(LvHModule hModule, LvFeature Feature, int64_t Value)	63
5.10.2.48 LvSetPtr(LvHModule hModule, LvFeature Feature, void *pValue)	63
5.10.2.49 LvSetString(LvHModule hModule, LvFeature Feature, const char *pValue)	63

5.10.2.50	LvStartPollingThread(LvHModule hModule, uint32_t PollingTime, int32_t Poll↔ Children)	64
5.10.2.51	LvStopPollingThread(LvHModule hModule)	64
5.11	Firmware update functions	65
5.11.1	Detailed Description	65
5.11.2	Function Documentation	65
5.11.2.1	LvFwGetFilePattern(LvHModule hModule, uint32_t Which, char *pFilePattern, size_t Size)	65
5.11.2.2	LvFwGetLoadStatus(LvHModule hModule, uint32_t Which, uint32_t *pCurrent↔ ByteCount, uint32_t *plsLoading)	65
5.11.2.3	LvFwLoad(LvHModule hModule, uint32_t Which, const char *pFilePath)	65
5.12	SynView C++ API functions	67
5.12.1	Detailed Description	67
5.13	LvLibrary methods	68
5.13.1	Detailed Description	68
5.13.2	Function Documentation	68
5.13.2.1	CloseLibrary()	68
5.13.2.2	GetErrorMessage(LvStatus Error, char *pMessage, size_t Size)	68
5.13.2.3	GetErrorMessage(LvStatus Error)	69
5.13.2.4	GetLastErrorMessage(char *pMessage, size_t Size)	69
5.13.2.5	GetLastErrorMessage()	69
5.13.2.6	GetLibInfo(LvEnum Info, int32_t *pInfo, int32_t Param=0)	70
5.13.2.7	GetLibInfoStr(LvEnum Info, char *pInfoStr, size_t Size, int32_t Param=0)	70
5.13.2.8	GetLibInfoStr(LvEnum Info, std::string &sInfo, int32_t Param=0)	70
5.13.2.9	GetLibInfoStrSize(LvEnum Info, size_t *pSize, int32_t Param=0)	70
5.13.2.10	GetNumberOfSystems(uint32_t *pNumberOfSystems)	71
5.13.2.11	GetSystemId(uint32_t Index, char *pSystemId, size_t Size)	71
5.13.2.12	GetSystemId(uint32_t Index, std::string &sSystemId)	71
5.13.2.13	GetSystemIdSize(uint32_t Index, size_t *pSize)	71
5.13.2.14	GetVersion()	72
5.13.2.15	Log(const char *pLogMessage)	72
5.13.2.16	Logf(const char *pszFormat,...)	72
5.13.2.17	LvException(const char *pMessage, LvStatus Number)	72

SynView Reference Guide

Chapter 2

Module Index

2.1 Modules

Here is a list of all modules:

- SynView 130
 - SynView Plain C API functions 9
 - General purpose functions 10
 - System module functions 14
 - Interface module functions 18
 - Device module functions 21
 - Firmware update functions 65
 - Stream module functions 27
 - Buffer module functions 29
 - Event module functions 35
 - Renderer module functions 41
 - Feature control functions 44
 - SynView C++ API functions 67
 - LvLibrary methods 68
 - LvSystem methods 74
 - LvInterface methods 79
 - LvDevice methods 84
 - LvDevice firmware update methods 91
 - LvStream methods 93
 - LvBuffer methods 98
 - LvEvent methods 102
 - LvRenderer methods 107
 - LvModule methods 110
 - SynView defines and typedefs 131
 - LvStreamStart() flags definitions 219
 - LvStreamStop() flags definitions 220
 - LvDeviceUniSetLut() and LvDeviceUniGetLut() flags definitions 221
 - LvSaveFlag definitions 222
 - LvPixelFormat definitions 223
 - LvStatus definitions 268
 - SynView enumerations 133
 - Features 149
 - Enumeration entries 182
 - SynView Image Processing Library 142
 - Image Processing Library defines, typedefs and enums 143
 - Definitions for Enumeration Entry Info 147
 - LvStatus definitions 280

Image Processing Library functions	229
Common functions	230
Image initialization functions	231
Region of Interest (ROI) functions	234
Lookup Table (LUT) functions	235
Bayer decoding/encoding functions	244
Rotation and line manipulation functions	248
Pixel format conversion functions	252
Saving/loading functions	253
Overlay functions	256
RGB color correction and convolution functions	257
Shading correction functions	259
SynView INI file API	260

Chapter 3

Hierarchical Index

3.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

- LvException 290
- LvImgInfo 291
- LvLibrary 294
- LvModule 294
 - LvBuffer 287
 - LvDevice 288
 - LvEvent 289
 - LvInterface 291
 - LvRenderer 296
 - LvStream 297
 - LvSystem 298

Chapter 4

Class Index

4.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

LvBuffer	287
LvDevice	288
LvEvent	289
LvException	290
LvInterface	291
LvImgInfo	291
LvLibrary	294
LvModule	294
LvRenderer	296
LvStream	297
LvSystem	298

Chapter 5

Module Documentation

5.1 SynView Plain C API functions

Modules

- [General purpose functions](#)
- [System module functions](#)
- [Interface module functions](#)
- [Device module functions](#)
- [Stream module functions](#)
- [Buffer module functions](#)
- [Event module functions](#)
- [Renderer module functions](#)
- [Feature control functions](#)

5.1.1 Detailed Description

5.2 General purpose functions

Functions

- LV_EXTC LV_DLLIMPORT uint32_t [LvGetVersion](#) ()
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvOpenLibrary](#) ()
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvCloseLibrary](#) ()
- LV_EXTC LV_DLLIMPORT void [LvGetErrorMessage](#) ([LvStatus](#) Error, char *pMessage, size_t Size)
- LV_EXTC LV_DLLIMPORT void [LvGetLastErrorMessage](#) (char *pMessage, size_t Size)
- LV_EXTC LV_DLLIMPORT void [LvLog](#) (const char *pLogMessage)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvGetLibInfo](#) ([LvEnum](#) Info, int32_t *pInfo, int32_t Param)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvGetLibInfoStr](#) ([LvEnum](#) Info, char *pInfoStr, size_t Size, int32_t Param)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvGetLibInfoStrSize](#) ([LvEnum](#) Info, size_t *pSize, int32_t Param)

5.2.1 Detailed Description

5.2.2 Function Documentation

5.2.2.1 LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvCloseLibrary](#) ()

Closes the SynView library. This must be done before you exit your application. Be sure to close first all dependent modules (System). If you are using SynView in a Windows DLL, avoid calling this in Windows DllMain() function - for proper functionality this function must be called when the application or DLL is still fully functional, which is not the case of PROCESS_DETACH in the DllMain(). If you have called [LvOpenLibrary\(\)](#) multiple times, you must balance it by the same number of calls of this function. Only the last call actually does the uninitialization. IMPORTANT: The library must not be opened again once it was already uninitialized.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.2.2.2 LV_EXTC LV_DLLIMPORT void [LvGetErrorMessage](#) ([LvStatus](#) Error, char * pMessage, size_t Size)

Returns a short description of the error. Note that only some of the errors are suitable for direct display to the user, many error values indicate states which are understandable to the programmer, but may not be understandable to the end user.

Parameters

<i>Error</i>	The error code (the return value of most SynView functions).
<i>pMessage</i>	Pointer to the text buffer.
<i>Size</i>	Size of the buffer.

See also

[LvStatus definitions](#).

5.2.2.3 LV_EXTC LV_DLLIMPORT void [LvGetLastErrorMessage](#) (char * pMessage, size_t Size)

Returns more detailed description of the last error, which happened in the thread from which this function was called. As the info is recorded inside SynView for each error, the description provides more detailed info, including the name of the function, in which the error happened, and possibly more diagnostic info. The difference to [LvGetErrorMessage\(\)](#) is that [LvGetLastErrorMessage\(\)](#) returns a static string from a numbered table of errors while this

function returns additionally info recorded at the time the error happened. If a function returns LVSTATUS_OK, it does not reset this error message (for speed reasons) so the correct approach is to get the error number as the function return value and if this return value is not LVSTATUS_OK, then you can get more info about the error using this function. be sure to call it from the same thread.

Parameters

<i>pMessage</i>	Pointer to the text buffer.
<i>Size</i>	Size of the buffer.

See also

[LvStatus definitions.](#)

5.2.2.4 LV_EXTC LV_DLLIMPORT LvStatus LvGetLibInfo (LvEnum *Info*, int32_t * *pInfo*, int32_t *Param*)

Gets a general info in form of a 32-bit integer value.

Parameters

<i>Info</i>	One of the LvLibInfo values.
<i>pInfo</i>	The value is returned in this parameter.
<i>Param</i>	Additional parameter, required by some types of info.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.2.2.5 LV_EXTC LV_DLLIMPORT LvStatus LvGetLibInfoStr (LvEnum *Info*, char * *pInfoStr*, size_t *Size*, int32_t *Param*)

Gets a general info in form of a string value.

Parameters

<i>Info</i>	One of the LvLibInfo values.
<i>pInfoStr</i>	The string value is returned in this parameter.
<i>Size</i>	Size of the buffer (to which pInfoStr points).
<i>Param</i>	Additional parameter, required by some types of info.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.2.2.6 LV_EXTC LV_DLLIMPORT LvStatus LvGetLibInfoStrSize (LvEnum *Info*, size_t * *pSize*, int32_t *Param*)

Gets a buffer size needed for a general info in form of a string value.

Parameters

<i>Info</i>	One of the LvLibInfo values.
<i>pSize</i>	Size of the buffer is returned in this parameter.
<i>Param</i>	Additional parameter, required by some types of info.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.2.2.7 LV_EXTC LV_DLLIMPORT uint32_t LvGetVersion ()

Returns SynView version.

Returns

The returned doubleword contains the build version in the low word and the high word is the major version in the upper byte and subversion in the lower byte. For example:

```
1 uint32_t Version = LvGetVersion();
2 printf("SynView %d.%02d.%03d",
3       ((Version >> 24) & 0xFF),
4       ((Version >> 16) & 0xFF),
5       (Version & 0xFFFF));
```

5.2.2.8 LV_EXTC LV_DLLIMPORT void LvLog (const char * *pLogMessage*)

Adds a line to the sv.synview.log. The SynView log is a tool for New Electronic Technology technical support, in some cases may be useful to put to the log additional info from your code.

Parameters

<i>pLogMessage</i>	Pointer to the null terminated string with the message.
--------------------	---

5.2.2.9 LV_EXTC LV_DLLIMPORT LvStatus LvOpenLibrary ()

Opens the SynView library. This must be done before you can use any other SynView function (with the exception of [LvGetVersion\(\)](#) and [LvGetErrorMessage\(\)](#)). If you are using SynView in Windows DLL, avoid calling this in Windows DIIMain() function - for proper functionality this function must be called when the application or DLL is already fully initialized and there are no restrictions about synchronization (DIIMain has such restrictions). If you call this function multiple times, you must balance it by the same number of the [LvCloseLibrary\(\)](#) calls. Only the first call will actually do the initialization. IMPORTANT: The library must not be opened again once it was already uninitialized.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.3 System module functions

Functions

- LV_EXTC LV_DLLIMPORT [LvStatus LvUpdateSystemList](#) ()
- LV_EXTC LV_DLLIMPORT [LvStatus LvGetNumberOfSystems](#) (uint32_t *pNumberOfSystems)
- LV_EXTC LV_DLLIMPORT [LvStatus LvGetSystemId](#) (uint32_t Index, char *pSystemId, size_t Size)
- LV_EXTC LV_DLLIMPORT [LvStatus LvGetSystemIdSize](#) (uint32_t Index, size_t *pSize)
- LV_EXTC LV_DLLIMPORT [LvStatus LvSystemOpen](#) (const char *pSystemId, [LvHSystem](#) *phSystem)
- LV_EXTC LV_DLLIMPORT [LvStatus LvSystemClose](#) ([LvHSystem](#) *phSystem)
- LV_EXTC LV_DLLIMPORT [LvStatus LvSystemUpdateInterfaceList](#) ([LvHSystem](#) hSystem, uint32_t Timeout)
- LV_EXTC LV_DLLIMPORT [LvStatus LvSystemGetNumberOfInterfaces](#) ([LvHSystem](#) hSystem, uint32_t *pNumberOfInterfaces)
- LV_EXTC LV_DLLIMPORT [LvStatus LvSystemGetInterfaceId](#) ([LvHSystem](#) hSystem, uint32_t Index, char *pInterfaceId, size_t Size)
- LV_EXTC LV_DLLIMPORT [LvStatus LvSystemGetInterfaceIdSize](#) ([LvHSystem](#) hSystem, uint32_t Index, size_t *pSize)
- LV_EXTC LV_DLLIMPORT [LvStatus LvSystemFindInterface](#) ([LvHSystem](#) hSystem, [LvEnum](#) FindBy, const char *pFindStr, char *pInterfaceId, size_t Size)

5.3.1 Detailed Description

5.3.2 Function Documentation

5.3.2.1 LV_EXTC LV_DLLIMPORT LvStatus LvGetNumberOfSystems (uint32_t * pNumberOfSystems)

Returns the number of systems found after the [LvUpdateSystemList\(\)](#) call. Typical use of this function is in iterating systems using the [LvGetSystemId\(\)](#) function.

Parameters

<i>pNumberOfSystems</i>	The number of systems found.
-------------------------	------------------------------

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.3.2.2 LV_EXTC LV_DLLIMPORT LvStatus LvGetSystemId (uint32_t Index, char * pSystemId, size_t Size)

Returns the string ID of the system at given index. This ID is used in the [LvSystemOpen\(\)](#) function for opening the system.

Parameters

<i>Index</i>	Zero-based index of the system, a value ≥ 0 and $<$ number of systems, returned by the LvGetNumberOfSystems() function.
<i>pSystemId</i>	Pointer to a string buffer, where the system ID will be placed.
<i>Size</i>	Size of the buffer.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.3.2.3 LV_EXTC LV_DLLIMPORT LvStatus LvGetSystemIdSize (uint32_t Index, size_t * pSize)

Returns the size of the string buffer needed to hold the system ID string, including the terminating zero character.

Parameters

<i>Index</i>	Zero-based index of the system, a value ≥ 0 and $<$ number of systems, returned by the LvGetNumberOfSystems() function.
<i>pSize</i>	Size of the buffer is returned in this parameter.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.3.2.4 LV_EXTC LV_DLLIMPORT LvStatus LvSystemClose (LvHSystem * *phSystem*)

Closes the opened system. Actually it means freeing the corresponding GenTL library. Be sure you first close all dependent modules (Interface, Event etc.). If the System was opened multiple times, it only decreases the reference counter (see the note by the [LvSystemOpen\(\)](#)).

Parameters

<i>phSystem</i>	Pointer to a handle to the System module, obtained from the LvSystemOpen() function. The handle is assigned 0 after the operation.
-----------------	--

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.3.2.5 LV_EXTC LV_DLLIMPORT LvStatus LvSystemFindInterface (LvHSystem *hSystem*, LvEnum *FindBy*, const char * *pFindStr*, char * *pInterfaceld*, size_t *Size*)

Finds the interface according specified criteria and returns a string ID of the interface, which is used by the [LvInterfaceOpen\(\)](#) function. This function does not update the interface list - if you need to do so, call the [LvSystemUpdateInterfaceList\(\)](#) function before calling this function.

Parameters

<i>hSystem</i>	A handle to the System module, obtained from the LvSystemOpen() function.
<i>FindBy</i>	Specifies by which criteria to find the interface. Use one of the LvFindBy constants.
<i>pFindStr</i>	Specifies the find string, the meaning of which is determined by the FindBy parameter, for example when using the LvFindBy_IPAddress , this string should contain the IP address searched for. The searched string is not case sensitive and need not be complete (is searched as a substring).
<i>pInterfaceld</i>	Pointer to a string buffer, where the interface ID will be placed.
<i>Size</i>	Size of the string buffer.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#). If the Interface is found, the returned status is LVSTATUS_OK.

5.3.2.6 LV_EXTC LV_DLLIMPORT LvStatus LvSystemGetInterfaceld (LvHSystem *hSystem*, uint32_t *Index*, char * *pInterfaceld*, size_t *Size*)

Returns a string ID of the interface, which is used by the [LvInterfaceOpen\(\)](#) function.

Parameters

<i>hSystem</i>	A handle to the System module, obtained from the LvSystemOpen() function.
<i>Index</i>	Zero-based index of the interface, a value ≥ 0 and $<$ number of interfaces, returned by the LvSystemGetNumberOfInterfaces() function.
<i>pInterfaceId</i>	Pointer to a string buffer, where the interface ID will be placed.
<i>Size</i>	Size of the string buffer.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.3.2.7 `LV_EXTC LV_DLLIMPORT LvStatus LvSystemGetInterfaceIdSize (LvHSystem hSystem, uint32_t Index, size_t * pSize)`

Returns the size of the string buffer needed to hold the Interface ID string, including the terminating zero character.

Parameters

<i>hSystem</i>	A handle to the System module, obtained from the LvSystemOpen() function.
<i>Index</i>	Zero-based index of the interface, a value ≥ 0 and $<$ number of interfaces, returned by the LvSystemGetNumberOfInterfaces() function.
<i>pSize</i>	Size of the buffer is returned in this parameter.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.3.2.8 `LV_EXTC LV_DLLIMPORT LvStatus LvSystemGetNumberOfInterfaces (LvHSystem hSystem, uint32_t * pNumberOfInterfaces)`

Returns the number of found interfaces, after the [LvSystemUpdateInterfaceList\(\)](#) call.

Parameters

<i>hSystem</i>	A handle to the System module, obtained from the LvSystemOpen() function.
<i>pNumberOfInterfaces</i>	Number of interfaces found.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.3.2.9 `LV_EXTC LV_DLLIMPORT LvStatus LvSystemOpen (const char * pSystemId, LvHSystem * phSystem)`

Opens the System module. Opening the system actually means loading the corresponding GenTL library. Note that before you can open the System, the [LvOpenLibrary\(\)](#) must be called. The same system can be open multiple times (there is a reference counter inside); in such case there must be also the same number of [LvSystemClose\(\)](#) calls used (every open increase the reference count and every close decreases it).

Parameters

<i>pSystemId</i>	A string ID of the system. This can be either an empty string - then the default system is opened, or it can be a string obtained from the LvGetSystemId() function.
<i>phSystem</i>	Pointer to a handle to the opened System module.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.3.2.10 LV_EXTC LV_DLLIMPORT LvStatus LvSystemUpdateInterfaceList (LvHSystem hSystem, uint32_t Timeout)

Updates the internal list of available interfaces. You can then iterate through them by [LvSystemGetNumberOfInterfaces\(\)](#) and [LvSystemGetInterfaceId\(\)](#).

Parameters

<i>hSystem</i>	A handle to the System module, obtained from the LvSystemOpen() function.
<i>Timeout</i>	Specifies a timeout in ms for searching the interfaces. This applies only to special cases of interfaces, where some delay can happen; common interfaces are detected without any significant delays.

Returns

If the timeout has expired while waiting for the completion, the function returns [LVSTATUS_TIMEOUT](#), otherwise it returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.3.2.11 LV_EXTC LV_DLLIMPORT LvStatus LvUpdateSystemList ()

Updates the list of systems available. This function must be called before iterating through the systems by the [LvGetNumberOfSystems\(\)](#) and [LvGetSystemId\(\)](#) functions. The systems are physically represented by GenTL libraries available in the operating systems, this call searches for them in standard locations. See also the description of the sv.synview.ini file in the SynView User's Guide. Note that this function is seldom needed, most applications will work with the default system (see [LvSystemOpen\(\)](#) for details).

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.4 Interface module functions

Functions

- LV_EXTC LV_DLLIMPORT [LvStatus LvInterfaceOpen](#) ([LvHSystem](#) hSystem, const char *pInterfaceld, [LvHInterface](#) *phInterface)
- LV_EXTC LV_DLLIMPORT [LvStatus LvInterfaceClose](#) ([LvHInterface](#) *phInterface)
- LV_EXTC LV_DLLIMPORT [LvStatus LvInterfaceUpdateDeviceList](#) ([LvHInterface](#) hInterface, uint32_t Timeout)
- LV_EXTC LV_DLLIMPORT [LvStatus LvInterfaceGetNumberOfDevices](#) ([LvHInterface](#) hInterface, uint32_t *pDevices)
- LV_EXTC LV_DLLIMPORT [LvStatus LvInterfaceGetDeviceld](#) ([LvHInterface](#) hInterface, uint32_t Index, char *pDeviceld, size_t Size)
- LV_EXTC LV_DLLIMPORT [LvStatus LvInterfaceGetDeviceldSize](#) ([LvHInterface](#) hInterface, uint32_t Index, size_t *pSize)
- LV_EXTC LV_DLLIMPORT [LvStatus LvInterfaceFindDevice](#) ([LvHInterface](#) hInterface, [LvEnum](#) FindBy, const char *pFindStr, char *pDeviceld, size_t Size)

5.4.1 Detailed Description

5.4.2 Function Documentation

5.4.2.1 LV_EXTC LV_DLLIMPORT LvStatus LvInterfaceClose (LvHInterface * phInterface)

Closes the interface. If the Interface was opened multiple times, it only decreases the reference counter (see a note by the [LvInterfaceOpen\(\)](#)). Be sure you first close all dependent modules (Device, Event etc.).

Parameters

<i>phInterface</i>	Pointer to a handle to the Interface module, obtained from the LvInterfaceOpen() function. The handle is assigned 0 after the operation.
--------------------	--

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.4.2.2 LV_EXTC LV_DLLIMPORT LvStatus LvInterfaceFindDevice (LvHInterface hInterface, LvEnum FindBy, const char * pFindStr, char * pDeviceld, size_t Size)

Finds the device according specified criteria and returns a string ID of the device, which can be used by the [LvDeviceOpen\(\)](#) function. This function does not update the device list - if you need to do so, call the [LvInterfaceUpdateDeviceList\(\)](#) function before calling this function.

Parameters

<i>hInterface</i>	A handle to the Interface module, obtained from the LvInterfaceOpen() function.
<i>FindBy</i>	Specifies by which criteria to find the interface. Use one of the LvFindBy constants.
<i>pFindStr</i>	Specifies the find string, the meaning of which is determined by the FindBy parameter, for example when using the LvFindBy_IPAddress , this string should contain the IP address searched for. The searched string is not case sensitive and need not be complete (is searched as a substring).

<i>pDeviceId</i>	Pointer to a string buffer, where the device ID will be placed.
<i>Size</i>	Size of the buffer.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#). If the Device is found, the returned status is LVSTATUS_OK.

5.4.2.3 LV_EXTC LV_DLLIMPORT LvStatus LvInterfaceGetDeviceId (LvHInterface hInterface, uint32_t Index, char * pDeviceId, size_t Size)

Returns a string ID of the device at specified position in the list. Note that this device ID is stable (the same physical device has always the same ID) and it is unique (no other physical device can have the same ID). To hardcode directly the device ID in your application is not recommended, as the application would not be usable, when a defective device needs to be replaced. The SynView User's Guide discuss the ways, how to solve such maintainability demands.

Parameters

<i>hInterface</i>	A handle to the Interface module, obtained from the LvInterfaceOpen() function.
<i>Index</i>	Zero-based index of the device, a value ≥ 0 and $<$ number of devices, returned by the LvInterfaceGetNumberOfDevices() function.
<i>pDeviceId</i>	Pointer to a string buffer, where the device ID will be placed.
<i>Size</i>	Size of the buffer.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.4.2.4 LV_EXTC LV_DLLIMPORT LvStatus LvInterfaceGetDeviceIdSize (LvHInterface hInterface, uint32_t Index, size_t * pSize)

Returns the size of the string buffer needed to hold the Device ID string, including the terminating zero character.

Parameters

<i>hInterface</i>	A handle to the Interface module, obtained from the LvInterfaceOpen() function.
<i>Index</i>	Zero-based index of the device, a value ≥ 0 and $<$ number of devices, returned by the LvInterfaceGetNumberOfDevices() function.
<i>pSize</i>	Size of the buffer is returned in this parameter.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.4.2.5 LV_EXTC LV_DLLIMPORT LvStatus LvInterfaceGetNumberOfDevices (LvHInterface hInterface, uint32_t * pDevices)

Returns the number of devices found by the [LvInterfaceUpdateDeviceList\(\)](#) function.

Parameters

<i>hInterface</i>	A handle to the Interface module, obtained from the LvInterfaceOpen() function.
<i>pDevices</i>	Number of devices found.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.4.2.6 LV_EXTC LV_DLLIMPORT LvStatus LvInterfaceOpen (LvHSystem hSystem, const char * pInterfaceId, LvHInterface * phInterface)

Opens the Interface module. The same Interface can be open multiple times (there is a reference counter inside); in such case there must be also the same number of [LvInterfaceClose\(\)](#) calls used (every open increase the reference count and every close decreases it) .

Parameters

<i>hSystem</i>	A handle to the System module, obtained from the LvSystemOpen() function.
<i>pInterfaceId</i>	A string interface ID, obtained by the LvSystemGetInterfaceId() .
<i>phInterface</i>	In this parameter the handle to the interface is returned.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.4.2.7 LV_EXTC LV_DLLIMPORT LvStatus LvInterfaceUpdateDeviceList (LvHInterface hInterface, uint32_t Timeout)

Updates the Device list. The available devices are searched.

Parameters

<i>hInterface</i>	A handle to the Interface module, obtained from the LvInterfaceOpen() function.
<i>Timeout</i>	Specifies a timeout in ms for searching the devices.

Returns

If the timeout has expired while waiting for the completion, the function returns [LVSTATUS_TIMEOUT](#), otherwise it returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.5 Device module functions

Modules

- [Firmware update functions](#)

Functions

- LV_EXTC LV_DLLIMPORT [LvStatus LvDeviceOpen](#) ([LvHInterface](#) hInterface, const char *pDeviceId, [LvHDevice](#) *phDevice, [LvEnum](#) Access)
- LV_EXTC LV_DLLIMPORT [LvStatus LvDeviceReOpen](#) ([LvHInterface](#) hInterface, const char *pDeviceId, [LvHDevice](#) hDevice, [LvEnum](#) Access)
- LV_EXTC LV_DLLIMPORT [LvStatus LvDeviceClose](#) ([LvHDevice](#) *phDevice)
- LV_EXTC LV_DLLIMPORT [LvStatus LvDeviceGetNumberOfStreams](#) ([LvHDevice](#) hDevice, uint32_t *pNumberOfStreams)
- LV_EXTC LV_DLLIMPORT [LvStatus LvDeviceGetStreamId](#) ([LvHDevice](#) hDevice, uint32_t Index, char *pStreamId, size_t Size)

5.5.1 Detailed Description

5.5.2 Function Documentation

5.5.2.1 [LvStatus LvDevice::LoadBatch](#) (const char * *pFileName*)

Loads device batch commands from a file.

Parameters

<i>pFileName</i>	The file specification, where the configuration is stored. It is a text file.
------------------	---

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.5.2.2 LV_EXTC LV_DLLIMPORT [LvStatus LvDeviceAcquisitionAbort](#) ([LvHDevice](#) *hDevice*, uint32_t *Options*)

Aborts the acquisition immediately, without completing the current Frame or waiting on a trigger.

Parameters

<i>hDevice</i>	A handle to the Device module, obtained from the LvDeviceOpen() function.
<i>Options</i>	Reserved for future use, must be 0 or omitted.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.5.2.3 LV_EXTC LV_DLLIMPORT LvStatus LvDeviceAcquisitionArm (LvHDevice hDevice, uint32_t Options)

Prepares the device for acquisition, so that the acquisition using the [LvDeviceAcquisitionStart\(\)](#) function then can start fast. If it is not called before [LvDeviceAcquisitionStart\(\)](#), it is called automatically inside the [LvDeviceAcquisitionStart\(\)](#).

Parameters

<i>hDevice</i>	A handle to the Device module, obtained from the LvDeviceOpen() function.
<i>Options</i>	Reserved for future use, must be 0 or omitted.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.5.2.4 LV_EXTC LV_DLLIMPORT LvStatus LvDeviceAcquisitionStart (LvHDevice hDevice, uint32_t Options)

Starts the acquisition. This function includes more than just calling the AcquisitionStart remote command on the device - it checks the size of the buffers, prepares the streams for the start, locks GenTL params and then starts the acquisition on the device itself. Always check the success of this function call.

Parameters

<i>hDevice</i>	A handle to the Device module, obtained from the LvDeviceOpen() function.
<i>Options</i>	Reserved for future use, must be 0 or omitted.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.5.2.5 LV_EXTC LV_DLLIMPORT LvStatus LvDeviceAcquisitionStop (LvHDevice hDevice, uint32_t Options)

Stops the acquisition.

Parameters

<i>hDevice</i>	A handle to the Device module, obtained from the LvDeviceOpen() function.
<i>Options</i>	Reserved for future use, must be 0 or omitted.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.5.2.6 LV_EXTC LV_DLLIMPORT LvStatus LvDeviceClose (LvHDevice * phDevice)

Closes the Device. Be sure you first close all dependent modules (Stream, Event etc.).

Parameters

<i>phDevice</i>	Pointer to a handle to the Device module, obtained from the LvDeviceOpen() function. This handle is assigned 0 after the operation.
-----------------	---

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.5.2.7 LV_EXTC LV_DLLIMPORT LvStatus LvDeviceGetNumberOfStreams (LvHDevice hDevice, uint32_t * pNumberOfStreams)

Returns the number of available stream types for this device. You can then iterate the streams by the [LvDeviceGetStreamId\(\)](#) function.

Parameters

<i>hDevice</i>	A handle to the Device module, obtained from the LvDeviceOpen() function.
<i>pNumberOfStreams</i>	The number of streams is returned here.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.5.2.8 LV_EXTC LV_DLLIMPORT LvStatus LvDeviceGetStreamId (LvHDevice hDevice, uint32_t Index, char * pStreamId, size_t Size)

Returns a string Stream ID, needed for opening the stream.

Parameters

<i>hDevice</i>	A handle to the Device module, obtained from the LvDeviceOpen() function.
<i>Index</i>	Zero-based index of the stream type, a value ≥ 0 and $<$ number of streams, returned by the LvDeviceGetNumberOfStreams() function.
<i>pStreamId</i>	Pointer to a string buffer, where the stream ID will be placed.
<i>Size</i>	Size of the buffer.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.5.2.9 LV_EXTC LV_DLLIMPORT LvStatus LvDeviceGetStreamIdSize (LvHDevice hDevice, uint32_t Index, size_t * pSize)

Returns the size of the string buffer needed to hold the stream ID at given index, including the space for the terminating zero character.

Parameters

<i>hDevice</i>	A handle to the Device module, obtained from the LvDeviceOpen() function.
<i>Index</i>	Zero-based index of the stream type, a value ≥ 0 and $<$ number of streams, returned by the LvDeviceGetNumberOfStreams() function.

<i>pSize</i>	Size of the buffer is returned in this parameter.
--------------	---

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.5.2.10 LV_EXTC LV_DLLIMPORT LvStatus LvDeviceLoadBatch (LvHDevice *hDevice*, const char * *pFileName*)

Loads device batch commands from a file.

Parameters

<i>hDevice</i>	A handle to the Device module, obtained from the LvDeviceOpen() function.
<i>pFileName</i>	The file specification, where the configuration is stored. It is a text file.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.5.2.11 LV_EXTC LV_DLLIMPORT LvStatus LvDeviceLoadSettings (LvHDevice *hDevice*, const char * *pId*, const char * *pFileName*, uint32_t *Options*)

Loads the device settings from a file. In the Options can be specified which parts of the device configuration are to be loaded - the Remote, Local and/or GenTL part. Note that there are several factors, which can break the compatibility of the settings file with the current device:

- When the current device is of different vendor/model, the settings file is most probably not compatible.
- When the current device is of the same vendor/model, but uses a different firmware version - this could mean that some remote device features are not present or behave differently.
- When the XML version of the Local and GenTL features changes - again this could mean that some features are not present or behave differently. For this reason this function checks the versions and if not the same, it returns either the [LVSTATUS_SETTINGS_INCOMPATIBLE_MODEL](#) or [LVSTATUS_SETTINGS_INCOMPATIBLE_VERSION](#) error states. As the difference in versions might not necessarily mean a real incompatibility, you can use the [LvSaveFlag_IgnoreVersion](#) and [LvSaveFlag_IgnoreModel](#) flags in the Options parameter in order to force this function to try to load the settings even if the possible incompatibility is found.

Parameters

<i>hDevice</i>	A handle to the Device module, obtained from the LvDeviceOpen() function.
<i>pId</i>	A string ID enabling to protect the file. If you specify a non-empty ID in LvDeviceSaveSettings() , you must use the same ID in LvDeviceLoadSettings() , otherwise the settings are not loaded.
<i>pFileName</i>	The file specification, where the configuration is stored. It is a text file.
<i>Options</i>	One or or-ed combination of LvSaveFlag definitions .

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.5.2.12 LV_EXTC LV_DLLIMPORT LvStatus LvDeviceOpen (LvHInterface *hInterface*, const char * *pDeviceId*, LvHDevice * *phDevice*, LvEnum *Access*)

Opens the Device module. This physically means opening a connection with the device and retrieving a list of device remote features. Always check the success of this function call; the opening may fail for example when you request an exclusive access and the device is already open by some other application.

Parameters

<i>hInterface</i>	A handle to the Interface module, obtained from the LvInterfaceOpen() function.
<i>pDeviceId</i>	A string ID of the device, obtained by LvInterfaceGetDeviceId() function.
<i>phDevice</i>	In this parameter the handle to the Device is returned.
<i>Access</i>	Desired device access, one of the LvDeviceAccess constants.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.5.2.13 LV_EXTC LV_DLLIMPORT LvStatus LvDeviceReOpen (LvHInterface hInterface, const char * pDeviceId, LvHDevice hDevice, LvEnum Access)

Re-Opens the Device. does not create a new class, just tries to reopen the connection

Parameters

<i>hInterface</i>	A handle to the Interface module, obtained from the LvInterfaceOpen() function.
<i>pDeviceId</i>	A string ID of the device, obtained by LvInterfaceGetDeviceId() function.
<i>hDevice</i>	The handle to the Device
<i>Access</i>	Desired device access, one of the LvDeviceAccess constants.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.5.2.14 LV_EXTC LV_DLLIMPORT LvStatus LvDeviceSaveSettings (LvHDevice hDevice, const char * pId, const char * pFileName, uint32_t Options)

Saves the device settings to a file. In the Options can be specified which parts of the device configuration are to be saved - the Remote, Local and/or GenTL part. See also notes by [LvDeviceLoadSettings\(\)](#).

Parameters

<i>hDevice</i>	A handle to the Device module, obtained from the LvDeviceOpen() function.
<i>pId</i>	A string ID enabling to protect the file. If you specify a non-empty ID in LvDeviceSaveSettings() , you must use the same ID in LvDeviceLoadSettings() , otherwise the settings are not loaded.
<i>pFileName</i>	The file specification, to which the configuration is stored. It is a text file.
<i>Options</i>	One or or-ed combination of LvSaveFlag definitions .

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.5.2.15 LV_EXTC LV_DLLIMPORT LvStatus LvDeviceUniGetLut (LvHDevice hDevice, LvEnum Selector, void * pLUT, size_t Size, uint32_t Options)

Gets the lookup table. See [LvDeviceUniSetLut\(\)](#) for details. The LUT is automatically recalculated to appropriate type, if you use different LUT bit depth than is the actually used for the current pixel format. So you can for example read the 12-bit LUT to 8-bit LUT array.

Parameters

<i>hDevice</i>	A handle to the Device module, obtained from the LvDeviceOpen() function.
<i>Selector</i>	Lookup table selector, see LvLUTSelector .
<i>pLUT</i>	Pointer to the lookup table.
<i>Size</i>	Size of the lookup table. The only valid values are <ul style="list-style-type: none"> • 256 for 8-bit LUT • 2048 for 10-bit LUT • 8192 for 12-bit LUT
<i>Options</i>	The <code>LvUniLutFlags_HwLut</code> option can be used to apply to function directly on HW LUT.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.5.2.16 `LV_EXTC LV_DLLIMPORT LvStatus LvDeviceUniSetLut (LvHDevice hDevice, LvEnum Selector, void * pLUT, size_t Size, uint32_t Options)`

Sets the lookup table. If the hardware lookup table is available, it is used, otherwise a software lookup table is set. This function belongs to a set of functions, which unify the functionality of devices with real-time processing embedded in hardware (RTF) and devices without real-time processing, for which the processing is made by software. The LUT is automatically recalculated to appropriate type, if you use different LUT bit depth than is the actually used for the current pixel format.

Parameters

<i>hDevice</i>	A handle to the Device module, obtained from the LvDeviceOpen() function.
<i>Selector</i>	Lookup table selector, see LvLUTSelector .
<i>pLUT</i>	Pointer to the lookup table.
<i>Size</i>	Size of the lookup table. The only valid values are <ul style="list-style-type: none"> • 256 for 8-bit LUT • 2048 for 10-bit LUT • 8192 for 12-bit LUT
<i>Options</i>	The <code>LvUniLutFlags_HwLut</code> option can be used to apply to function directly on HW LUT.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.6 Stream module functions

Functions

- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvStreamOpen](#) ([LvHDevice](#) hDevice, const char *pStreamId, [LvHStream](#) *phStream)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvStreamClose](#) ([LvHStream](#) *phStream)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvStreamGetBufferAt](#) ([LvHStream](#) hStream, uint32_t BufferIndex, [LvHBuffer](#) *phBuffer)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvStreamFlushQueue](#) ([LvHStream](#) hStream, [LvEnum](#) Operation)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvStreamStart](#) ([LvHStream](#) hStream, uint32_t StartFlags, uint32_t ImagesToAcquire)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvStreamStop](#) ([LvHStream](#) hStream, uint32_t StopFlags)

5.6.1 Detailed Description

5.6.2 Function Documentation

5.6.2.1 LV_EXTC LV_DLLIMPORT LvStatus LvStreamClose (LvHStream * phStream)

Closes the Stream. Be sure you first close all dependent modules (Buffers, Event, Renderer etc.).

Parameters

<i>phStream</i>	Pointer to a handle to the Stream module, obtained from the LvStreamOpen() function. This handle is assigned 0 after the operation.
-----------------	---

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.6.2.2 LV_EXTC LV_DLLIMPORT LvStatus LvStreamFlushQueue (LvHStream hStream, LvEnum Operation)

Moves the buffers according to the LvQueueOperation specified.

Parameters

<i>hStream</i>	A handle to the Stream module, obtained from the LvStreamOpen() function.
<i>Operation</i>	One of the LvQueueOperation .

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.6.2.3 LV_EXTC LV_DLLIMPORT LvStatus LvStreamGetBufferAt (LvHStream hStream, uint32_t BufferIndex, LvHBuffer * phBuffer)

Returns the buffer handle at given index.

Parameters

<i>hStream</i>	A handle to the Stream module, obtained from the LvStreamOpen() function.
<i>BufferIndex</i>	Zero-based index.
<i>phBuffer</i>	In this parameter the buffer handle is returned.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.6.2.4 `LV_EXTC LV_DLLIMPORT LvStatus LvStreamOpen (LvHDevice hDevice, const char * pStreamId, LvHStream * phStream)`

Opens the stream module, associated with the device.

Parameters

<i>hDevice</i>	A handle to the Device module, obtained from the LvDeviceOpen() function.
<i>pStreamId</i>	A string ID of the stream, obtained from LvDeviceGetStreamId() . If an empty string is used, the first found stream is opened. This is usually the image data stream.
<i>phStream</i>	In this parameter the handle to the Stream is returned.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.6.2.5 `LV_EXTC LV_DLLIMPORT LvStatus LvStreamStart (LvHStream hStream, uint32_t StartFlags, uint32_t ImagesToAcquire)`

Starts the stream. This function need not be used on the image stream, where it is called automatically in the [LvDeviceAcquisitionStart\(\)](#) function.

Parameters

<i>hStream</i>	A handle to the Stream module, obtained from the LvStreamOpen() function.
<i>StartFlags</i>	One of the <code>GroupSynview_StreamStartFlags</code> .
<i>ImagesToAcquire</i>	Number of images to acquire.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.6.2.6 `LV_EXTC LV_DLLIMPORT LvStatus LvStreamStop (LvHStream hStream, uint32_t StopFlags)`

Stops the stream. This function need not be used on the image stream, where it is called automatically in the [LvDeviceAcquisitionStop\(\)](#) function.

Parameters

<i>hStream</i>	A handle to the Stream module, obtained from the LvStreamOpen() function.
<i>StopFlags</i>	One of the <code>GroupSynview_StreamStopFlags</code> .

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.7 Buffer module functions

Functions

- LV_EXTC LV_DLLIMPORT [LvStatus LvBufferOpen](#) ([LvHStream](#) hStream, void *pDataPointer, size_t DataSize, void *pUserPointer, uint32_t Options, [LvHBuffer](#) *phBuffer)
- LV_EXTC LV_DLLIMPORT [LvStatus LvBufferClose](#) ([LvHBuffer](#) *phBuffer)
- LV_EXTC LV_DLLIMPORT [LvStatus LvBufferAttachProcessBuffer](#) ([LvHBuffer](#) hBuffer, void *pDataPointer, size_t DataSize)
- LV_EXTC LV_DLLIMPORT [LvStatus LvBufferQueue](#) ([LvHBuffer](#) hBuffer)
- LV_EXTC LV_DLLIMPORT [LvStatus LvBufferParseChunkData](#) ([LvHBuffer](#) hBuffer, uint32_t UpdateLayout)
- LV_EXTC LV_DLLIMPORT [LvStatus LvBufferSaveImageToBmpFile](#) ([LvHBuffer](#) hBuffer, const char *pFileName)
- LV_EXTC LV_DLLIMPORT [LvStatus LvBufferSaveImageToJpgFile](#) ([LvHBuffer](#) hBuffer, const char *pFileName, uint32_t Quality)
- LV_EXTC LV_DLLIMPORT [LvStatus LvBufferSaveImageToTifFile](#) ([LvHBuffer](#) hBuffer, const char *pFileName, uint32_t Options)
- LV_EXTC LV_DLLIMPORT [LvStatus LvBufferGetImgInfo](#) ([LvHBuffer](#) hBuffer, [LviImgInfo](#) *pImgInfo, uint32_t Options)
- LV_EXTC LV_DLLIMPORT [LvStatus LvBufferGetLastPaintRect](#) ([LvHBuffer](#) hBuffer, int32_t *pX, int32_t *pY, int32_t *pWidth, int32_t *pHeight)
- LV_EXTC LV_DLLIMPORT [LvStatus LvBufferUniCalculateWhiteBalance](#) ([LvHBuffer](#) hBuffer)

5.7.1 Detailed Description

5.7.2 Function Documentation

5.7.2.1 LV_EXTC LV_DLLIMPORT LvStatus LvBufferAttachProcessBuffer (LvHBuffer hBuffer, void * pDataPointer, size_t DataSize)

Attaches a process buffer to a buffer. The process buffer may be needed for software processing, for example Bayer decoding, if the device hardware is not capable of it. The process buffer can be either supplied by the application by this function, or allocated automatically by SynView upon need.

Parameters

<i>hBuffer</i>	A handle to the Buffer module, obtained from the LvBufferOpen() function.
<i>pDataPointer</i>	Pointer to the supplied buffer.
<i>DataSize</i>	Size of the buffer.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.7.2.2 LV_EXTC LV_DLLIMPORT LvStatus LvBufferClose (LvHBuffer * phBuffer)

Closes the buffer. On the GenTL level it corresponds to the DSRevokeBuffer() function.

Parameters

<i>phBuffer</i>	A handle to the Buffer module, obtained from the LvBufferOpen() function. This handle is assigned 0 after the operation.
-----------------	--

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.7.2.3 LV_EXTC LV_DLLIMPORT LvStatus LvBufferGetImgInfo (LvHBuffer hBuffer, LvplmgInfo * plmgInfo, uint32_t Options)

Fills the [LvplmgInfo](#) structure for the image in the buffer. This simplifies a direct use of the [SynView Image Processing Library](#). If the image is processed, the image info points to the processed image, otherwise it points to the original image.

Parameters

<i>hBuffer</i>	A handle to the Buffer module, obtained from the LvBufferOpen() function.
<i>plmgInfo</i>	Pointer to the ImgInfo structure, to which are the image parameters stored.
<i>Options</i>	Currently unused, must be 0.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.7.2.4 LV_EXTC LV_DLLIMPORT LvStatus LvBufferGetLastPaintRect (LvHBuffer hBuffer, int32_t * pX, int32_t * pY, int32_t * pWidth, int32_t * pHeight)

Returns the rectangle to which the buffer was last painted. This is useful namely in case you have a tile mode and want to identify the buffer according a mouse click location. If the buffer was not yet painted by the renderer, the returned values are 0.

Parameters

<i>hBuffer</i>	A handle to the Buffer module, obtained from the LvBufferOpen() function.
<i>pX</i>	Pointer to X offset in pixels.
<i>pY</i>	Pointer to Y offset in pixels.
<i>pWidth</i>	Pointer to Width in pixels.
<i>pHeight</i>	Pointer to Height in pixels.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.7.2.5 LV_EXTC LV_DLLIMPORT LvStatus LvBufferOpen (LvHStream hStream, void * pDataPointer, size_t DataSize, void * pUserPointer, uint32_t Options, LvHBuffer * phBuffer)

Opens a buffer. On the GenTL level it corresponds to [DSAnnounceBuffer\(\)](#) or [DSAllocAndAnnounceBuffer\(\)](#).

Parameters

<i>hStream</i>	A handle to the Stream module, obtained from the LvStreamOpen() function.
<i>pDataPointer</i>	Pointer to image data buffer. This can be supplied by the application (in such case the DataSize must be set to the actual size of the buffer), or can be left NULL - in such case the buffer is allocated by SynView.
<i>DataSize</i>	Size of the buffer supplied, or 0 if the <i>pDataPointer</i> is NULL.
<i>pUserPointer</i>	A user pointer, which is then passed back in the LvEventCallbackNewBufferFunc() . It enables the application to reference some own data structure associated with the buffer.
<i>Options</i>	Currently unused, must be 0.
<i>phBuffer</i>	To this parameter the handle to the buffer is returned.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.7.2.6 LV_EXTC LV_DLLIMPORT LvStatus LvBufferParseChunkData (LvHBuffer *hBuffer*, uint32_t *UpdateLayout*)

Parses the chunk data of the image. The chunk data are then accessible as device remote features (for example [LvDevice_ChunkTimestamp](#)).

Parameters

<i>hBuffer</i>	A handle to the Buffer module, obtained from the LvBufferOpen() function.
<i>UpdateLayout</i>	If set to 1, the layout of chunk data is decoded. If set to 0, the data are only read from already decoded layout - this is faster. Usually, the layout of the chunk data is constant, so it needs to be decoded only at first call of this function.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.7.2.7 LV_EXTC LV_DLLIMPORT LvStatus LvBufferQueue (LvHBuffer hBuffer)

Puts the buffer to the input buffer pool. This is an important part of the image handling loop: after the buffer with the acquired image is passed to the application, the application must return it to the input buffer pool by this function after processing.

Parameters

<i>hBuffer</i>	A handle to the Buffer module, obtained from the LvBufferOpen() function.
----------------	---

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.7.2.8 LV_EXTC LV_DLLIMPORT LvStatus LvBufferSaveImageToBmpFile (LvHBuffer hBuffer, const char * pFileName)

Saves the image to a file in Windows BMP format. If the image is in the pixel format not compatible with the BMP format, it is automatically converted.

Parameters

<i>hBuffer</i>	A handle to the Buffer module, obtained from the LvBufferOpen() function.
<i>pFileName</i>	The file name. Be sure to specify it with the full path.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.7.2.9 LV_EXTC LV_DLLIMPORT LvStatus LvBufferSaveImageToJpgFile (LvHBuffer hBuffer, const char * pFileName, uint32_t Quality)

Saves the image to a file in JPEG format. If the image is in the pixel format not compatible with the JPEG format, it is automatically converted.

Parameters

<i>hBuffer</i>	A handle to the Buffer module, obtained from the LvBufferOpen() function.
<i>pFileName</i>	The file name. Be sure to specify it with the full path.
<i>Quality</i>	The quality factor in range from from 1 to 100. The higher is the factor, the higher is the quality and lower the compression.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.7.2.10 LV_EXTC LV_DLLIMPORT LvStatus LvBufferSaveImageToTifFile (LvHBuffer *hBuffer*, const char * *pFileName*, uint32_t *Options*)

Saves the image to a file in the TIFF format. If the image is in the pixel format not compatible with the TIF format, it is automatically converted.

Parameters

<i>hBuffer</i>	A handle to the Buffer module, obtained from the LvBufferOpen() function.
<i>pFileName</i>	The file name. Be sure to specify it with the full path.
<i>Options</i>	Options for saved pixel format. The LvipOption_TiffConvertTo16Bit flag can be used there.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.7.2.11 LV_EXTC LV_DLLIMPORT LvStatus LvBufferUniCalculateWhiteBalance (LvHBuffer hBuffer)

Calculates white balance factors from the current image.

Parameters

<i>hBuffer</i>	A handle to the Buffer module, obtained from the LvBufferOpen() function.
----------------	---

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.8 Event module functions

Functions

- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvEventOpen](#) ([LvHModule](#) hModule, [LvEnum](#) EventType, [LvHEvent](#) *phEvent)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvEventClose](#) ([LvHEvent](#) *phEvent)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvEventKill](#) ([LvHEvent](#) hEvent)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvEventFlush](#) ([LvHEvent](#) hEvent)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvEventWaitAndGetData](#) ([LvHEvent](#) hEvent, void *pBuffer, size_t *pSize, uint32_t Timeout)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvEventWaitAndGetNewBuffer](#) ([LvHEvent](#) hEvent, [LvHBuffer](#) *phBuffer, uint32_t Timeout)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvEventGetDataInfo](#) ([LvHEvent](#) hEvent, void *pInBuffer, size_t InSize, [LvEnum](#) Info, void *pBuffer, size_t *pSize, [LvEnum](#) *pType, int32_t Param)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvEventPutData](#) ([LvHEvent](#) hEvent, void *pBuffer, size_t Size)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvEventSetCallback](#) ([LvHEvent](#) hEvent, [LvEventCallbackFunc](#) pFunction, void *pUserParam)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvEventSetCallbackNewBuffer](#) ([LvHEvent](#) hEvent, [LvEventCallbackNewBufferFunc](#) pFunction, void *pUserParam)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvEventStartThread](#) ([LvHEvent](#) hEvent)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvEventStopThread](#) ([LvHEvent](#) hEvent)
- LV_EXTC LV_DLLIMPORT uint32_t [LvEventCallbackMustExit](#) ([LvHEvent](#) hEvent)

5.8.1 Detailed Description

5.8.2 Function Documentation

5.8.2.1 LV_EXTC LV_DLLIMPORT uint32_t LvEventCallbackMustExit (LvHEvent hEvent)

Indicates that the event callback function for [LvEventSetCallback](#) or [LvEventSetCallbackNewBuffer](#) needs to exit as soon as possible

Parameters

<i>hEvent</i>	A handle to the Event module, obtained from the LvEventOpen() function.
---------------	---

Returns

Returns the must exit status

5.8.2.2 LV_EXTC LV_DLLIMPORT LvStatus LvEventClose (LvHEvent * phEvent)

Closes the Event module.

Parameters

<i>phEvent</i>	A handle to the Event module, obtained from the LvEventOpen() function. This handle is assigned 0 after the operation.
----------------	--

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.8.2.3 LV_EXTC LV_DLLIMPORT LvStatus LvEventFlush (LvHEvent hEvent)

Discards all buffers in the output buffer queue (waiting to be delivered to the application).

Parameters

<i>hEvent</i>	A handle to the Event module, obtained from the LvEventOpen() function.
---------------	---

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.8.2.4 LV_EXTC LV_DLLIMPORT LvStatus LvEventGetDataInfo (LvHEvent hEvent, void * pInBuffer, size_t InSize, LvEnum Info, void * pBuffer, size_t * pSize, LvEnum * pType, int32_t Param)

Enables to parse the buffer from LvEventWaitAndGetData.

Parameters

<i>hEvent</i>	A handle to the Event module, obtained from the LvEventOpen() function.
<i>pInBuffer</i>	Pointer to a buffer containing event data. This value must not be NULL.
<i>InSize</i>	Size of the provided pInBuffer in bytes.
<i>Info</i>	One of the LvEventDataInfo .
<i>pBuffer</i>	Pointer to a user allocated buffer to receive the requested information. If this parameter is NULL, pSize will contain the minimal size of pBuffer in bytes. If the pType is a string, the size includes the terminating 0.
<i>pSize</i>	Size of the buffer is returned in this parameter.
<i>pType</i>	One of the LvInfoDataType .
<i>Param</i>	Additional parameter, if used, its role is explained by the LvEventDataInfo .

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.8.2.5 LV_EXTC LV_DLLIMPORT LvStatus LvEventKill (LvHEvent hEvent)

Terminates a single wait in the [LvEventWaitAndGetData\(\)](#) function.

Parameters

<i>hEvent</i>	A handle to the Event module, obtained from the LvEventOpen() function.
---------------	---

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.8.2.6 LV_EXTC LV_DLLIMPORT LvStatus LvEventOpen (LvHModule hModule, LvEnum EventType, LvHEvent * phEvent)

Opens the Event module for specified owner module.

Parameters

<i>hModule</i>	A handle to the System, Device or Stream module.
<i>EventType</i>	One of the LvEventType .
<i>phEvent</i>	To this parameter the Event handle is stored.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.8.2.7 LV_EXTC LV_DLLIMPORT LvStatus LvEventPutData (LvHEvent *hEvent*, void * *pBuffer*, size_t *Size*)

Puts a new event to Event output queue. This function can be used only for user-defined events.

Parameters

<i>hEvent</i>	A handle to the Event module, obtained from the LvEventOpen() function.
<i>pBuffer</i>	Pointer to event data.
<i>Size</i>	Size of the event data.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.8.2.8 `LV_EXTC LV_DLLIMPORT LvStatus LvEventSetCallback (LvHEvent hEvent, LvEventCallbackFunct pFunction, void * pUserParam)`

Specifies a callback function for the event thread. Note that the callback function cannot be a method of a class.

Parameters

<i>hEvent</i>	A handle to the Event module, obtained from the LvEventOpen() function.
<i>pFunction</i>	The callback function in the forms of LvEventCallbackFunct .
<i>pUserParam</i>	User parameter, which will be passed to each callback call.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.8.2.9 `LV_EXTC LV_DLLIMPORT LvStatus LvEventSetCallbackNewBuffer (LvHEvent hEvent, LvEventCallbackNewBufferFunct pFunction, void * pUserParam)`

Specifies a callback function for the thread of the Event of the [LvEventType_NewBuffer](#). Once the application specifies this callback, it becomes responsible for returning the image buffers to the input buffer pool. Note that the callback function cannot be a method of a class.

Parameters

<i>hEvent</i>	A handle to the Event module, obtained from the LvEventOpen() function.
<i>pFunction</i>	The callback function in the forms of LvEventCallbackNewBufferFunct .
<i>pUserParam</i>	User parameter, which will be passed to each callback call.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.8.2.10 `LV_EXTC LV_DLLIMPORT LvStatus LvEventStartThread (LvHEvent hEvent)`

Starts an internal thread, which waits for events and passes them to specified callback function. When the thread is started, the application must no longer call the [LvEventWaitAndGetData\(\)](#) or [LvEventWaitAndGetNewBufer\(\)](#) functions - this is called internally in the thread and upon return from this function a callback function is called.

Parameters

<i>hEvent</i>	A handle to the Event module, obtained from the LvEventOpen() function.
---------------	---

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.8.2.11 LV_EXTC LV_DLLIMPORT LvStatus LvEventStopThread (LvHEvent *hEvent*)

Stops the event internal thread.

Parameters

<i>hEvent</i>	A handle to the Event module, obtained from the LvEventOpen() function.
---------------	---

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.8.2.12 LV_EXTC LV_DLLIMPORT LvStatus LvEventWaitAndGetData (LvHEvent *hEvent*, void * *pBuffer*, size_t * *pSize*, uint32_t *Timeout*)

Waits for the event and gets its data in one atomic operation. Use this function only for events other than [LvEvent↔Type_NewBuffer](#), for the the [LvEventType_NewBuffer](#) event type use the [LvEventWaitAndGetNewBuffer\(\)](#) function instead. Do not use this function if you use the callback - see [LvEventSetCallback\(\)](#) or [LvEventSetCallbackNew↔Buffer\(\)](#).

Parameters

<i>hEvent</i>	A handle to the Event module, obtained from the LvEventOpen() function.
<i>pBuffer</i>	Pointer to a user allocated buffer to receive the event data. The buffer can be parsed by the LvEventGetDataInfo() function.
<i>pSize</i>	Size of the buffer must be specified in this parameter and after the function returns, the actual size is returned in this parameter.
<i>Timeout</i>	The wait timeout in milliseconds. The value 0xFFFFFFFF is considered as infinite. Note that you can also kill waiting from another thread using the LvEventKill() function.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.8.2.13 LV_EXTC LV_DLLIMPORT LvStatus LvEventWaitAndGetNewBuffer (LvHEvent *hEvent*, LvHBuffer * *phBuffer*, uint32_t *Timeout*)

Waits for the event and gets its data in one atomic operation. Use this function only for events of the [LvEvent↔Type_NewBuffer](#) type. Do not use this function if you use the callback - see [LvEventSetCallback\(\)](#) or [LvEventSet↔CallbackNewBuffer\(\)](#).

Parameters

<i>hEvent</i>	A handle to the Event module, obtained from the LvEventOpen() function.
<i>phBuffer</i>	The handle to the received buffer is returned in this parameter.
<i>Timeout</i>	The wait timeout in milliseconds. The value 0xFFFFFFFF is considered as infinite. Note that you can also kill waiting from another thread using the LvEventKill() function.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.9 Renderer module functions

Functions

- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvRendererOpen](#) ([LvHStream](#) hStream, [LvHRenderer](#) *phRenderer)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvRendererStart](#) ([LvHRenderer](#) *phRenderer)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvRendererStop](#) ([LvHRenderer](#) *phRenderer)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvRendererClose](#) ([LvHRenderer](#) *phRenderer)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvRendererSetWindow](#) ([LvHRenderer](#) hRenderer, void *pDisplay, int64_t hWindow)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvRendererCanDisplayImage](#) ([LvHRenderer](#) hRenderer, [LvHBuffer](#) hBuffer, uint32_t RenderFlags)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvRendererDisplayImage](#) ([LvHRenderer](#) hRenderer, [LvHBuffer](#) hBuffer, uint32_t RenderFlags)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvRendererRepaint](#) ([LvHRenderer](#) hRenderer, uint32_t RenderFlags)

5.9.1 Detailed Description

5.9.2 Function Documentation

5.9.2.1 LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvRendererCanDisplayImage](#) ([LvHRenderer](#) hRenderer, [LvHBuffer](#) hBuffer, uint32_t RenderFlags)

Checks, if the image can be displayed. Namely the possibility to convert the image to desired display pixel format is checked.

Parameters

<i>hRenderer</i>	A handle to the Renderer module, obtained from the LvRendererOpen() function.
<i>hBuffer</i>	The buffer to be displayed.
<i>RenderFlags</i>	Zero or a combination of LvRenderFlags .

Returns

Returns the [LvStatus](#) value; the value LVSTATUS_OK indicates the display is possible, the value LVSTATUS_US_DISPLAY_CANNOT_DISPLAY indicates impossibility of pixel format conversion or a misconfiguration of the renderer. See [LvStatus definitions](#).

5.9.2.2 LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvRendererClose](#) ([LvHRenderer](#) * phRenderer)

Closes the Renderer module.

Parameters

<i>phRenderer</i>	A handle to the Renderer module, obtained from the LvRendererOpen() function.
-------------------	---

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.9.2.3 LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvRendererDisplayImage](#) ([LvHRenderer](#) hRenderer, [LvHBuffer](#) hBuffer, uint32_t RenderFlags)

Displays the image. The image display mode is set by Renderer features, see [LvRendererFtr](#).

Parameters

<i>hRenderer</i>	A handle to the Renderer module, obtained from the LvRendererOpen() function.
<i>hBuffer</i>	The buffer to be displayed.
<i>RenderFlags</i>	Zero or a combination of LvRenderFlags .

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.9.2.4 LV_EXTC LV_DLLIMPORT LvStatus LvRendererOpen (LvHStream hStream, LvHRenderer * phRenderer)

Opens the Renderer module for image display. The renderer attempts to load the sv.synview.display library. In case of SynView installation in an operating system without possibility to graphically display (for example Linux without XWindows), the load of this library fails and the calls to Renderer functions will return errors.

Parameters

<i>hStream</i>	A handle to the Stream module, obtained from the LvStreamOpen() function.
<i>phRenderer</i>	In this parameter the handle to the renderer is returned.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.9.2.5 LV_EXTC LV_DLLIMPORT LvStatus LvRendererRepaint (LvHRenderer hRenderer, uint32_t RenderFlags)

Repaints the contents of the display window. In order to be able to repaint, all images to be displayed must be still held by the application, i.e. must not be returned to the input buffer pool. See also [LvStream_LvPostponeQueue↔Buffers](#) feature. A typical usage of this function is in the WM_PAINT handler in a Windows application.

Parameters

<i>hRenderer</i>	A handle to the Renderer module, obtained from the LvRendererOpen() function.
<i>RenderFlags</i>	Zero or a combination of LvRenderFlags .

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.9.2.6 LV_EXTC LV_DLLIMPORT LvStatus LvRendererSetWindow (LvHRenderer hRenderer, void * pDisplay, int64_t hWindow)

Sets the target window, in which the renderer has to display. Note that the application itself assure any repainting (when the window need to be repainted due to a movement of overlapping) - use [LvRendererRepaint\(\)](#) in such case.

Parameters

<i>hRenderer</i>	A handle to the Renderer module, obtained from the LvRendererOpen() function.
<i>pDisplay</i>	Pointer to the display. It is defined as void* in order to make SynView header files independent on XWindows.

<i>hWindow</i>	Handle to the window.
----------------	-----------------------

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.9.2.7 LV_EXTC LV_DLLIMPORT LvStatus LvRendererStart (LvHRenderer * phRenderer)

Starts the Renderer module.

Parameters

<i>phRenderer</i>	A handle to the Renderer module, obtained from the LvRendererOpen() function.
-------------------	---

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.9.2.8 LV_EXTC LV_DLLIMPORT LvStatus LvRendererStop (LvHRenderer * phRenderer)

Stops the Renderer module.

Parameters

<i>phRenderer</i>	A handle to the Renderer module, obtained from the LvRendererOpen() function.
-------------------	---

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.10 Feature control functions

Functions

- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvGetNumFeatures](#) ([LvHModule](#) hModule, [LvEnum](#) FeatureGroup, [uint32_t](#) *pNumItems)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvGetFeatureAt](#) ([LvHModule](#) hModule, [LvEnum](#) FeatureGroup, [uint32_t](#) Index, [LvFeature](#) *pItem, [uint32_t](#) *pLevel)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvGetFeatureByName](#) ([LvHModule](#) hModule, [LvEnum](#) FeatureGroup, [const char](#) *pName, [LvFeature](#) *pItem)
- LV_EXTC LV_DLLIMPORT [uint32_t](#) [LvIsImplemented](#) ([LvHModule](#) hModule, [LvFeature](#) Feature)
- LV_EXTC LV_DLLIMPORT [uint32_t](#) [LvIsImplementedByName](#) ([LvHModule](#) hModule, [LvEnum](#) FeatureGroup, [const char](#) *pName)
- LV_EXTC LV_DLLIMPORT [uint32_t](#) [LvIsImplementedEnumEntry](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, [LvEnum](#) EnumEntry)
- LV_EXTC LV_DLLIMPORT [uint32_t](#) [LvIsAvailable](#) ([LvHModule](#) hModule, [LvFeature](#) Feature)
- LV_EXTC LV_DLLIMPORT [uint32_t](#) [LvIsAvailableByName](#) ([LvHModule](#) hModule, [LvEnum](#) FeatureGroup, [const char](#) *pName)
- LV_EXTC LV_DLLIMPORT [uint32_t](#) [LvIsAvailableEnumEntry](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, [LvEnum](#) EnumEntry)
- LV_EXTC LV_DLLIMPORT [uint32_t](#) [LvIsReadable](#) ([LvHModule](#) hModule, [LvFeature](#) Feature)
- LV_EXTC LV_DLLIMPORT [uint32_t](#) [LvIsWritable](#) ([LvHModule](#) hModule, [LvFeature](#) Feature)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvGetType](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, [LvEnum](#) *pFtrType, [LvEnum](#) *pFtrGui, [LvEnum](#) *pFtrGroup)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvGetBool](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, [int32_t](#) *pValue)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvSetBool](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, [int32_t](#) Value)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvGetInt32](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, [int32_t](#) *pValue)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvSetInt32](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, [int32_t](#) Value)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvGetInt32Range](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, [int32_t](#) *pMinValue, [int32_t](#) *pMaxValue, [int32_t](#) *pIncrement)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvGetInt64](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, [int64_t](#) *pValue)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvSetInt64](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, [int64_t](#) Value)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvGetInt64Range](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, [int64_t](#) *pMinValue, [int64_t](#) *pMaxValue, [int64_t](#) *pIncrement)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvGetInt](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, [int64_t](#) *pValue)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvSetInt](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, [int64_t](#) Value)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvGetIntRange](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, [int64_t](#) *pMinValue, [int64_t](#) *pMaxValue, [int64_t](#) *pIncrement)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvGetFloat](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, [double](#) *pValue)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvSetFloat](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, [double](#) Value)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvGetFloatRange](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, [double](#) *pMinValue, [double](#) *pMaxValue, [double](#) *pIncrement)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvGetString](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, [char](#) *pValue, [size_t](#) Size)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvGetStringSize](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, [size_t](#) *pSize)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvSetString](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, [const char](#) *pValue)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvGetBuffer](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, [void](#) *pBuffer, [size_t](#) Size)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvGetBufferSize](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, [size_t](#) *pSize)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvSetBuffer](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, [void](#) *pBuffer, [size_t](#) Size)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvGetPtr](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, [void](#) **ppValue)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvSetPtr](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, [void](#) *pValue)

- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvGetEnum](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, [LvEnum](#) *p↔ Value)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvSetEnum](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, [LvEnum](#) Value)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvGetEnumStr](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, char *p↔ SymbolicName, size_t Size)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvSetEnumStr](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, const char *pSymbolicName)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvGetEnumValByStr](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, const char *pSymbolicName, [LvEnum](#) *pValue, [LvEnum](#) *pFtrAccess)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvGetEnumStrByVal](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, [LvEnum](#) Value, char *pSymbolicName, size_t SymbolicNameSize, [LvEnum](#) *pFtrAccess)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvCmdExecute](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, uint32_t↔ Timeout)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvCmdIsDone](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, uint32_t *p↔ IsDone)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvGetAccess](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, [LvEnum](#) *p↔ FtrAccess)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvGetVisibility](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, [LvEnum](#) *p↔ FtrVisibility)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvGetInfo](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, [LvEnum](#) FtrInfo, int32_t *pInfo, int32_t Param)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvGetInfoStr](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, [LvEnum](#) FtrInfo, char *pInfoStr, size_t Size, int32_t Param)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvGetInfoStrSize](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, [LvEnum](#) FtrInfo, size_t *pSize, int32_t Param)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvRegisterFeatureCallback](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, [LvFeatureCallbackFunc](#) pFunction, void *pUserParam, void *pFeatureParam)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvStartPollingThread](#) ([LvHModule](#) hModule, uint32_t PollingTime, int32_t PollChildren)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvStopPollingThread](#) ([LvHModule](#) hModule)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvPoll](#) ([LvHModule](#) hModule)

5.10.1 Detailed Description

5.10.2 Function Documentation

5.10.2.1 LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvCmdExecute](#) ([LvHModule](#) hModule, [LvFeature](#) Feature, uint32_t↔ Timeout)

Executes a command.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.
<i>Timeout</i>	If greater than 0, the LvCmdIsDone() is called in a loop to wait for the command completion, until the LvCmdIsDone() returns true or the Timeout (in milliseconds) expires. If set to 0, no wait is done.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.10.2.2 LV_EXTC LV_DLLIMPORT LvStatus LvCmdlsDone (LvHModule *hModule*, LvFeature *Feature*, uint32_t *
plsDone)

Checks if the command execution has completed.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.
<i>plsDone</i>	In this parameter is returned 1, if the command is completed, otherwise 0.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.10.2.3 `LV_EXTC LV_DLLIMPORT LvStatus LvGetAccess (LvHModule hModule, LvFeature Feature, LvEnum * pFtrAccess)`

Gets the access mode of the feature.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.
<i>pFtrAccess</i>	The access is returned in this parameter. One of the LvFtrAccess .

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.10.2.4 `LV_EXTC LV_DLLIMPORT LvStatus LvGetBool (LvHModule hModule, LvFeature Feature, int32_t * pValue)`

Gets a Boolean value (as 32-bit integer).

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.
<i>pValue</i>	The bool value (as 32-bit integer) is returned in this parameter.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.10.2.5 `LV_EXTC LV_DLLIMPORT LvStatus LvGetBuffer (LvHModule hModule, LvFeature Feature, void * pBuffer, size_t Size)`

Gets a block of data.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.

<i>pBuffer</i>	Pointer to a buffer, to which the data will be stored.
<i>Size</i>	Size of the buffer.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.10.2.6 LV_EXTC LV_DLLIMPORT LvStatus LvGetBufferSize (LvHModule hModule, LvFeature Feature, size_t * pSize)

Gets the block data size.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.
<i>pSize</i>	The needed size of the buffer is returned in this parameter.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.10.2.7 LV_EXTC LV_DLLIMPORT LvStatus LvGetEnum (LvHModule hModule, LvFeature Feature, LvEnum * pValue)

Gets the SynView constant for the enumeration entry, if exists. If does not exist, you must work with the string enumeration entry value.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.
<i>pValue</i>	SynView constant for the enum entry is returned in this parameter.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.10.2.8 LV_EXTC LV_DLLIMPORT LvStatus LvGetEnumStr (LvHModule hModule, LvFeature Feature, char * pSymbolicName, size_t Size)

Gets the enumeration entry as string (symbolic name). It is not possible to get the needed size for this single feature, instead, it is possible to get the maximum size of the all enum values of this feature, by the [LvGetInfo\(LvFtrlInfo_EnumEntryNameMaxSize\)](#) function.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.

<i>pSymbolicName</i>	A pointer to a string buffer, where the symbolic name will be returned.
<i>Size</i>	Size of the buffer.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.10.2.9 LV_EXTC LV_DLLIMPORT LvStatus LvGetEnumStrByVal (LvHModule hModule, LvFeature Feature, LvEnum Value, char * pSymbolicName, size_t SymbolicNameSize, LvEnum * pFtrAccess)

Returns a string symbolic name of the enum entry for the SynView constant.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.
<i>Value</i>	The SynView constant for the enum entry.
<i>pSymbolicName</i>	Pointer to string buffer, where the symbolic name is returned. Can be NULL.
<i>SymbolicNameSize</i>	Size of pSymbolicName buffer.
<i>pFtrAccess</i>	The access mode of the enum entry is returned in this parameter - one of LvFtrAccess . Can be NULL.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.10.2.10 LV_EXTC LV_DLLIMPORT LvStatus LvGetEnumValByStr (LvHModule hModule, LvFeature Feature, const char * pSymbolicName, LvEnum * pValue, LvEnum * pFtrAccess)

Gets the SynView constant for the enumeration entry, if exists.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.
<i>pSymbolicName</i>	A string with symbolic name of the enum entry.
<i>pValue</i>	The SynView constant for the enum entry is returned in this parameter. If the SynView constant does not exist for this enumeration entry, 0 is returned (no error is indicated).
<i>pFtrAccess</i>	The feature access is returned in this parameter - one of GroupSynview_LvFtrAccess . Can be NULL.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.10.2.11 LV_EXTC LV_DLLIMPORT LvStatus LvGetFeatureAt (LvHModule hModule, LvEnum FeatureGroup, uint32_t Index, LvFeature * pItem, uint32_t * pLevel)

Returns the feature ID at specified position. Can be used to iterate all the features in a list.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>FeatureGroup</i>	One of the LvFtrGroup .
<i>Index</i>	Zero based index of the feature in the list.
<i>pItem</i>	Feature ID is returned in this parameter.
<i>pLevel</i>	Feature Level expressing its position in the tree is returned in this parameter. The base level has value 1.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.10.2.12 `LV_EXTC LV_DLLIMPORT LvStatus LvGetFeatureByName (LvHModule hModule, LvEnum FeatureGroup, const char * pName, LvFeature * pItem)`

Returns a feature ID based on the feature name. This function is a substantial function for the generic approach to the feature - by this function you can get the ID of any existing feature, that means also for those, for which a SynView constant is not defined. Be sure to check the success of this function - if the feature is not mandatory, it may not exist.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>FeatureGroup</i>	One of the LvFtrGroup .
<i>pName</i>	Name of the feature.
<i>pItem</i>	Feature ID is returned in this parameter.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.10.2.13 `LV_EXTC LV_DLLIMPORT LvStatus LvGetFloat (LvHModule hModule, LvFeature Feature, double * pValue)`

Gets a float value.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.
<i>pValue</i>	The float value is returned in this parameter.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.10.2.14 `LV_EXTC LV_DLLIMPORT LvStatus LvGetFloatRange (LvHModule hModule, LvFeature Feature, double * pMinValue, double * pMaxValue, double * pIncrement)`

Returns a range of a float feature.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.
<i>pMinValue</i>	The minimum value is returned in this parameter. Can be NULL.
<i>pMaxValue</i>	The maximum value is returned in this parameter. Can be NULL.
<i>pIncrement</i>	The increment value is returned in this parameter. If the increment is not defined, 0 is returned. Can be NULL.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.10.2.15 `LV_EXTC LV_DLLIMPORT LvStatus LvGetInfo (LvHModule hModule, LvFeature Feature, LvEnum FtrInfo, int32_t * pInfo, int32_t Param)`

Gets an info in form of a 32-bit integer value.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.
<i>FtrInfo</i>	One of the LvFtrInfo .
<i>pInfo</i>	The value is returned in this parameter.
<i>Param</i>	Additional parameter, required by some types of info.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.10.2.16 `LV_EXTC LV_DLLIMPORT LvStatus LvGetInfoStr (LvHModule hModule, LvFeature Feature, LvEnum FtrInfo, char * pInfoStr, size_t Size, int32_t Param)`

Gets an info in form of a string value.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.
<i>FtrInfo</i>	One of the LvFtrInfo .
<i>pInfoStr</i>	The string value is returned in this parameter.
<i>Size</i>	Size of the buffer (to which pInfoStr points).
<i>Param</i>	Additional parameter, required by some types of info.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.10.2.17 `LV_EXTC LV_DLLIMPORT LvStatus LvGetInfoStrSize (LvHModule hModule, LvFeature Feature, LvEnum FtrInfo, size_t * pSize, int32_t Param)`

Gets a buffer size needed for an info in form of a string value.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.
<i>FtrInfo</i>	One of the LvFtrInfo .
<i>pSize</i>	Size of the buffer is returned in this parameter.
<i>Param</i>	Additional parameter, required by some types of info.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.10.2.18 LV_EXTC LV_DLLIMPORT LvStatus LvGetInt (LvHModule *hModule*, LvFeature *Feature*, int64_t * *pValue*)

Gets a 64-bit integer value.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.
<i>pValue</i>	The integer value is returned in this parameter.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

Note

This function is equal to the [LvGetInt64\(\)](#) function.

5.10.2.19 LV_EXTC LV_DLLIMPORT LvStatus LvGetInt32 (LvHModule *hModule*, LvFeature *Feature*, int32_t * *pValue*)

Gets a 32-bit integer value.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.
<i>pValue</i>	The integer value is returned in this parameter.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

Note

The value is internally kept always as a 64-bit value; the functions for setting and getting a 32-bit value are provided just for convenience.

5.10.2.20 LV_EXTC LV_DLLIMPORT LvStatus LvGetInt32Range (LvHModule *hModule*, LvFeature *Feature*, int32_t * *pMinValue*, int32_t * *pMaxValue*, int32_t * *pIncrement*)

Returns a range and increment of an 32-bit integer feature.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.
<i>pMinValue</i>	The minimum value is returned in this parameter. Can be NULL.
<i>pMaxValue</i>	The maximum value is returned in this parameter. Can be NULL.
<i>pIncrement</i>	The increment value is returned in this parameter. Can be NULL.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

Note

The value is internally kept always as a 64-bit value; the functions for setting and getting a 32-bit value are provided just for convenience.

5.10.2.21 LV_EXTC LV_DLLIMPORT LvStatus LvGetInt64 (LvHModule hModule, LvFeature Feature, int64_t * pValue)

Gets a 64-bit integer value.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.
<i>pValue</i>	The integer value is returned in this parameter.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

Note

This function is equal to the [LvGetInt\(\)](#) function.

5.10.2.22 LV_EXTC LV_DLLIMPORT LvStatus LvGetInt64Range (LvHModule hModule, LvFeature Feature, int64_t * pMinValue, int64_t * pMaxValue, int64_t * pIncrement)

Returns a range and increment of an 64-bit integer feature.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.
<i>pMinValue</i>	The minimum value is returned in this parameter. Can be NULL.
<i>pMaxValue</i>	The maximum value is returned in this parameter. Can be NULL.
<i>pIncrement</i>	The increment value is returned in this parameter. Can be NULL.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

Note

This function is equal to the [LvGetIntRange\(\)](#) function.

5.10.2.23 LV_EXTC LV_DLLIMPORT LvStatus LvGetIntRange (LvHModule *hModule*, LvFeature *Feature*, int64_t * *pMinValue*, int64_t * *pMaxValue*, int64_t * *pIncrement*)

Returns a range and increment of an 64-bit integer feature.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.
<i>pMinValue</i>	The minimum value is returned in this parameter. Can be NULL.
<i>pMaxValue</i>	The maximum value is returned in this parameter. Can be NULL.
<i>pIncrement</i>	The increment value is returned in this parameter. Can be NULL.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

Note

This function is equal to the [LvGetInt64Range\(\)](#) function.

5.10.2.24 LV_EXTC LV_DLLIMPORT LvStatus LvGetNumFeatures (LvHModule hModule, LvEnum FeatureGroup, uint32_t * pNumItems)

Returns a number of features for specified group. This is useful for building a list of all available features (like the tree in lvexplorer).

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>FeatureGroup</i>	One of the LvFtrGroup .
<i>pNumItems</i>	The number of features is returned in this parameter.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.10.2.25 LV_EXTC LV_DLLIMPORT LvStatus LvGetPtr (LvHModule hModule, LvFeature Feature, void ** ppValue)

Gets a pointer.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.
<i>ppValue</i>	The pointer is returned in this parameter.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.10.2.26 LV_EXTC LV_DLLIMPORT LvStatus LvGetString (LvHModule hModule, LvFeature Feature, char * pValue, size_t Size)

Gets a string value. If you need first to get the string size, use the [LvGetStringSize\(\)](#) function.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.
<i>pValue</i>	Pointer to a null-terminated string buffer.
<i>Size</i>	Size of the buffer.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.10.2.27 `LV_EXTC LV_DLLIMPORT LvStatus LvGetStringSize (LvHModule hModule, LvFeature Feature, size_t * pSize)`

Gets a buffer size needed for a string.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.
<i>pSize</i>	Size of the buffer (including space for terminating zero) is returned in this parameter.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.10.2.28 `LV_EXTC LV_DLLIMPORT LvStatus LvGetType (LvHModule hModule, LvFeature Feature, LvEnum * pFtrType, LvEnum * pFtrGui, LvEnum * pFtrGroup)`

Returns the feature type, GUI representation and group.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.
<i>pFtrType</i>	The feature type is returned in this parameter. The returned value is one of the LvFtrType . Can be NULL.
<i>pFtrGui</i>	The feature GUI representation is returned in this parameter. The returned value is one of the LvFtrGui . Can be NULL.
<i>pFtrGroup</i>	The feature group, to which the feature belongs. The returned value is one of the LvFtrGroup . Can be NULL.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.10.2.29 `LV_EXTC LV_DLLIMPORT LvStatus LvGetVisibility (LvHModule hModule, LvFeature Feature, LvEnum * pFtrVisibility)`

Gets the feature visibility (beginner-expert-guru).

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.
<i>pFtrVisibility</i>	The visibility is returned in this parameter. One of the LvFtrVisibility .

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.10.2.30 LV_EXTC LV_DLLIMPORT uint32_t LvsAvailable (LvHModule hModule, LvFeature Feature)

A helper function, allowing simply to determine, if a feature is available. It is a wrapper around the [LvGetAccess\(\)](#) function.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.

Returns

If the feature is available, returns 1, otherwise 0.

5.10.2.31 LV_EXTC LV_DLLIMPORT uint32_t LvsAvailableByName (LvHModule hModule, LvEnum FeatureGroup, const char * pName)

A helper function, allowing simply to determine, if a feature is available. It is a wrapper around the [LvGetAccess\(\)](#) and [LvGetFeatureByName\(\)](#) functions.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>FeatureGroup</i>	One of the LvFtrGroup .
<i>pName</i>	Name of the feature.

Returns

If the feature is available, returns 1, otherwise 0.

5.10.2.32 LV_EXTC LV_DLLIMPORT uint32_t LvsAvailableEnumEntry (LvHModule hModule, LvFeature Feature, LvEnum EnumEntry)

A helper function, allowing simply to determine, if an enum entry of an enum feature is available.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.

<i>EnumEntry</i>	The SynView constant for the enum entry.
------------------	--

Returns

If the enum entry is available, returns 1, otherwise 0.

5.10.2.33 LV_EXTC LV_DLLIMPORT uint32_t LvlIsImplemented (LvHModule *hModule*, LvFeature *Feature*)

A helper function, allowing simply to determine, if a feature is implemented. It is a wrapper around the [LvGetAccess\(\)](#) function.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.

Returns

If the feature is implemented, returns 1, otherwise 0.

5.10.2.34 LV_EXTC LV_DLLIMPORT uint32_t LvlIsImplementedByName (LvHModule *hModule*, LvEnum *FeatureGroup*, const char * *pName*)

A helper function, allowing simply to determine, if a feature is implemented. It is a wrapper around the [LvGetAccess\(\)](#) and [LvGetFeatureByName\(\)](#) functions.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>FeatureGroup</i>	One of the LvFtrGroup .
<i>pName</i>	Name of the feature.

Returns

If the feature is implemented, returns 1, otherwise 0.

5.10.2.35 LV_EXTC LV_DLLIMPORT uint32_t LvlIsImplementedEnumEntry (LvHModule *hModule*, LvFeature *Feature*, LvEnum *EnumEntry*)

A helper function, allowing simply to determine, if an enum entry of an enum feature is implemented.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.
<i>EnumEntry</i>	The SynView constant for the enum entry.

Returns

If the enum entry is implemented, returns 1, otherwise 0.

5.10.2.36 LV_EXTC LV_DLLIMPORT uint32_t LvlIsReadable (LvHModule *hModule*, LvFeature *Feature*)

A helper function, allowing simply to determine, if a feature is readable. It is a wrapper around the [LvGetAccess\(\)](#) function.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.

Returns

If the feature is readable, returns 1, otherwise 0.

5.10.2.37 LV_EXTC LV_DLLIMPORT uint32_t LvsWritable (LvHModule hModule, LvFeature Feature)

A helper function, allowing simply to determine, if a feature is writable. It is a wrapper around the [LvGetAccess\(\)](#) function.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.

Returns

If the feature is writable, returns 1, otherwise 0.

5.10.2.38 LV_EXTC LV_DLLIMPORT LvStatus LvPoll (LvHModule hModule)

Polls all the non-cached features of the module. If the feature polling interval expires, the value is read and the feature callback is called.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream or Renderer module.
----------------	---

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.10.2.39 LV_EXTC LV_DLLIMPORT LvStatus LvRegisterFeatureCallback (LvHModule hModule, LvFeature Feature, LvFeatureCallbackFunc pFunction, void * pUserParam, void * pFeatureParam)

Registers or unregisters a callback function for the feature. This callback is produced by GenApi when a feature changes its value or status. The application should process this callback fast. Note that the callback can be called also from another thread - see [LvEventType_FeatureDevEvent](#). Important note: The feature callback function should never set any other feature. Doing so can lead to recursions, which would be probably hard to diagnose and could cause unexpected behavior.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.

<i>pFunction</i>	The callback function in the form of <code>LvFeatureCallbackFunc</code> . If you want to unregister the function, use NULL at this parameter.
<i>pUserParam</i>	User parameter, which will be passed to each callback call.
<i>pFeatureParam</i>	Second user parameter, which will be passed to each callback call.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.10.2.40 LV_EXTC LV_DLLIMPORT LvStatus LvSetBool (LvHModule hModule, LvFeature Feature, int32_t Value)

Sets a Boolean value.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.
<i>Value</i>	Value to be set (in form of 32_bit integer value).

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.10.2.41 LV_EXTC LV_DLLIMPORT LvStatus LvSetBuffer (LvHModule hModule, LvFeature Feature, void * pBuffer, size_t Size)

Sets a block of data.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.
<i>pBuffer</i>	Pointer to the data.
<i>Size</i>	Size of the data.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.10.2.42 LV_EXTC LV_DLLIMPORT LvStatus LvSetEnum (LvHModule hModule, LvFeature Feature, LvEnum Value)

Sets the enumeration entry by the SynView constant. If the SynView constant is not defined for the feature, then use [LvSetEnumStr\(\)](#) to set the enum entry by a string.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.

<i>Value</i>	SynView constant for the requested enumeration entry.
--------------	---

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.10.2.43 `LV_EXTC LV_DLLIMPORT LvStatus LvSetEnumStr (LvHModule hModule, LvFeature Feature, const char * pSymbolicName)`

Sets enumeration entry by its string symbolic name.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.
<i>pSymbolicName</i>	A pointer to a string with the symbolic name of the enumeration entry.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.10.2.44 `LV_EXTC LV_DLLIMPORT LvStatus LvSetFloat (LvHModule hModule, LvFeature Feature, double Value)`

Sets a float value.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.
<i>Value</i>	The value to be set.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.10.2.45 `LV_EXTC LV_DLLIMPORT LvStatus LvSetInt (LvHModule hModule, LvFeature Feature, int64_t Value)`

Sets a 64-bit integer value.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.
<i>Value</i>	Value to be set.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

Note

This function is equal to the [LvSetInt64\(\)](#) function.

5.10.2.46 LV_EXTC LV_DLLIMPORT LvStatus LvSetInt32 (LvHModule *hModule*, LvFeature *Feature*, int32_t *Value*)

Sets a 32-bit value.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.
<i>Value</i>	Value to be set.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

Note

The value is internally kept always as a 64-bit value; the functions for setting and getting a 32-bit value are provided just for convenience.

5.10.2.47 LV_EXTC LV_DLLIMPORT LvStatus LvSetInt64 (LvHModule *hModule*, LvFeature *Feature*, int64_t *Value*)

Sets a 64-bit integer value.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.
<i>Value</i>	Value to be set.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

Note

This function is equal to the [LvSetInt\(\)](#) function.

5.10.2.48 LV_EXTC LV_DLLIMPORT LvStatus LvSetPtr (LvHModule *hModule*, LvFeature *Feature*, void * *pValue*)

Sets a pointer.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.
<i>pValue</i>	The pointer to be set.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.10.2.49 LV_EXTC LV_DLLIMPORT LvStatus LvSetString (LvHModule *hModule*, LvFeature *Feature*, const char * *pValue*)

Sets a string value.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream, Event, Buffer or Renderer module.
<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvGetFeatureByName() function.
<i>pValue</i>	The string value (null-terminated).

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.10.2.50 LV_EXTC LV_DLLIMPORT LvStatus LvStartPollingThread (LvHModule *hModule*, uint32_t *PollingTime*, int32_t *PollChildren*)

Starts a thread, which in a loop polls the non-cached features. If the feature polling interval expires, the value is read and the feature callback is called.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream or Renderer module.
<i>PollingTime</i>	A time in milliseconds between 2 calls to poll the features.
<i>PollChildren</i>	If set to true, also the features in all children modules are polled. For example, if your application uses only one System module, then it is a parent of all other modules, so the polling will be propagated to all modules from a single thread. If a module has started own polling thread, then it is excluded from the propagating.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.10.2.51 LV_EXTC LV_DLLIMPORT LvStatus LvStopPollingThread (LvHModule *hModule*)

Stops the polling thread. See [LvStartPollingThread\(\)](#) for details.

Parameters

<i>hModule</i>	A handle to the System, Interface, Device, Stream or Renderer module.
----------------	---

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.11 Firmware update functions

Functions

- LV_EXTC LV_DLLIMPORT [LvStatus LvFwGetFilePattern](#) ([LvHModule](#) hModule, uint32_t Which, char *p↔FilePattern, size_t Size)
- LV_EXTC LV_DLLIMPORT [LvStatus LvFwLoad](#) ([LvHModule](#) hModule, uint32_t Which, const char *pFile↔Path)
- LV_EXTC LV_DLLIMPORT [LvStatus LvFwGetLoadStatus](#) ([LvHModule](#) hModule, uint32_t Which, uint32_t *pCurrentByteCount, uint32_t *pIsLoading)

5.11.1 Detailed Description

5.11.2 Function Documentation

5.11.2.1 LV_EXTC LV_DLLIMPORT LvStatus LvFwGetFilePattern (LvHModule hModule, uint32_t Which, char * pFilePattern, size_t Size)

Returns the file name mask (with wildcard characters), for searching the file with the appropriate firmware update. The files with the FW update have in their names coded the hardware IDs, so using this mask (for example in a filter in a file open dialog box) assures the file appropriate for this device is used.

Parameters

<i>hModule</i>	A handle to the Device module.
<i>Which</i>	An ID specific for a hardware. Discussed in the SynView User's Guide.
<i>pFilePattern</i>	In this parameter the file pattern is returned.
<i>Size</i>	Size of the buffer (to which the pFilePattern points).

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.11.2.2 LV_EXTC LV_DLLIMPORT LvStatus LvFwGetLoadStatus (LvHModule hModule, uint32_t Which, uint32_t * pCurrentByteCount, uint32_t * pIsLoading)

Returns the byte count and whether the loading is still in progress.

Parameters

<i>hModule</i>	A handle to the Device module.
<i>Which</i>	An ID specific for a hardware. Discussed in the SynView User's Guide.
<i>pCurrentByte↔Count</i>	Returns number of bytes transferred so far.
<i>pIsLoading</i>	Returns 1 if the loading is still in progress.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.11.2.3 LV_EXTC LV_DLLIMPORT LvStatus LvFwLoad (LvHModule hModule, uint32_t Which, const char * pFilePath)

Loads the firmware from a file to the hardware. It can be very long process (taking minutes) and this functions blocks the thread during this process. It is recommended to check the load status from another thread using the [LvFwGetLoadStatus\(\)](#) function.

Parameters

<i>hModule</i>	A handle to the Device module.
<i>Which</i>	An ID specific for a hardware. Discussed in the SynView User's Guide.
<i>pFilePath</i>	File specification, with full path.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

- static [LvStatus](#) [LvLibrary::GetSystemId](#) (uint32_t Index, std::string &sSystemId)
- static void [LvLibrary::SetThrowErrorEnable](#) (bool bEnable)

5.13.1 Detailed Description

5.13.2 Function Documentation

5.13.2.1 static [LvStatus](#) [LvLibrary::CloseLibrary](#) () [static]

Closes the SynView library. This must be performed before you exit your application. Be sure to close first all dependent modules (System). If you are using SynView in a Windows DLL, avoid calling this in Windows DllMain() function - for proper functionality this function must be called when the application or DLL is still fully functional, which is not the case of PROCESS_DETACH in the DllMain(). If you have called [LvLibrary::OpenLibrary\(\)](#) multiple times, you must balance it by the same number of calls of this function. Only the last call actually does the uninitialization. IMPORTANT: The library must not be opened again once it was already uninitialized.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.13.2.2 static void [LvLibrary::GetErrorMessage](#) ([LvStatus](#) Error, char * pMessage, size_t Size) [static]

Returns a short description of the error. Note that only some of the errors are suitable for direct display to the user, many error values indicate states which are understandable to the programmer, but may not be understandable to the end user.

Parameters

<i>Error</i>	The error code (the return value of most SynView functions).
<i>pMessage</i>	Pointer to the text buffer.
<i>Size</i>	Size of the buffer.

See also

[LvStatus definitions.](#)

5.13.2.3 static std::string LvLibrary::GetErrorMessage (LvStatus *Error*) [static]

Returns a short description of the error. Note that only some of the errors are suitable for direct display to the user, many error values indicate states which are understandable to the programmer, but may not be understandable to the end user.

Parameters

<i>Error</i>	The error code (the return value of most SynView functions).
--------------	--

Returns

Error message in std::string.

See also

[LvStatus definitions.](#)

5.13.2.4 static void LvLibrary::GetLastErrorMessage (char * *pMessage*, size_t *Size*) [static]

Returns more detailed description of the last error, which happened in the thread from which this function was called. As the info is recorded inside SynView for each error, the description provides more detailed info, including the name of the function, in which the error happened, and possibly more diagnostic info. The difference to [LvLibrary::GetErrorMessage\(\)](#) is that [LvLibrary::GetErrorMessage\(\)](#) returns a static string from a numbered table of errors while this function returns additionally info recorded at the time the error happened. If a function returns LVSTATUS_OK, it does not reset this error message (for speed reasons) so the correct approach is to get the error number as the function return value and if this return value is not LVSTATUS_OK, then you can get more info about the error using this function. be sure to call it from the same thread.

Parameters

<i>pMessage</i>	Pointer to the text buffer.
<i>Size</i>	Size of the buffer.

See also

[LvStatus definitions.](#)

5.13.2.5 static std::string LvLibrary::GetLastErrorMessage () [static]

Returns more detailed description of the last error, which happened in the thread from which this function was called. As the info is recorded inside SynView for each error, the description provides more detailed info, including the name of the function, in which the error happened, and possibly more diagnostic info. The difference to [LvLibrary::GetErrorMessage\(\)](#) is that [LvLibrary::GetErrorMessage\(\)](#) returns a static string from a numbered table of errors while this function returns additionally info recorded at the time the error happened. If a function returns LVSTATUS_OK, it does not reset this error message (for speed reasons) so the correct approach is to get the error number as the function return value and if this return value is not LVSTATUS_OK, then you can get more info about the error using this function. be sure to call it from the same thread.

Returns

Error message in `std::string`.

See also

[LvStatus definitions](#).

5.13.2.6 `static LvStatus LvLibrary::GetLibInfo (LvEnum Info, int32_t * pInfo, int32_t Param = 0)` `[static]`

Gets a general info in form of a 32-bit integer value.

Parameters

<i>Info</i>	One of the LvLibInfo values.
<i>pInfo</i>	The value is returned in this parameter.
<i>Param</i>	Additional parameter, required by some types of info.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.13.2.7 `static LvStatus LvLibrary::GetLibInfoStr (LvEnum Info, char * pInfoStr, size_t Size, int32_t Param = 0)`
`[static]`

Gets a general info in form of a string value.

Parameters

<i>Info</i>	One of the LvLibInfo values.
<i>pInfoStr</i>	The string value is returned in this parameter.
<i>Size</i>	Size of the buffer (to which pInfoStr points).
<i>Param</i>	Additional parameter, required by some types of info.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.13.2.8 `static LvStatus LvLibrary::GetLibInfoStr (LvEnum Info, std::string & sInfo, int32_t Param = 0)` `[static]`

Gets a general info in form of a `std::string` value.

Parameters

<i>Info</i>	One of the LvLibInfo values.
<i>sInfo</i>	The string value is returned in this parameter.
<i>Param</i>	Additional parameter, required by some types of info.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.13.2.9 `static LvStatus LvLibrary::GetLibInfoStrSize (LvEnum Info, size_t * pSize, int32_t Param = 0)` `[static]`

Gets a buffer size needed for a general info in form of a string value.

Parameters

<i>Info</i>	One of the LvLibInfo values.
<i>pSize</i>	Size of the buffer is returned in this parameter.
<i>Param</i>	Additional parameter, required by some types of info.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.13.2.10 static LvStatus LvLibrary::GetNumberOfSystems (uint32_t* pNumberOfSystems) [static]

Returns the number of systems found after the [LvLibrary::UpdateSystemList\(\)](#) call. Typical use of this function is in iterating systems using the [LvLibrary::GetSystemId\(\)](#) function.

Parameters

<i>pNumberOfSystems</i>	The number of systems found.
-------------------------	------------------------------

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.13.2.11 static LvStatus LvLibrary::GetSystemId (uint32_t Index, char * pSystemId, size_t Size) [static]

Returns the string ID of the system at given index. This ID is used in the [LvSystem::Open\(\)](#) function for opening the system.

Parameters

<i>Index</i>	Zero-based index of the system, a value ≥ 0 and $<$ number of systems, returned by the LvLibrary::GetNumberOfSystems() function.
<i>pSystemId</i>	Pointer to a string buffer, where the system ID will be placed.
<i>Size</i>	Size of the buffer.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.13.2.12 static LvStatus LvLibrary::GetSystemId (uint32_t Index, std::string & sSystemId) [static]

Returns the string ID of the system at given index. This ID is used in the [LvSystem::Open\(\)](#) function for opening the system.

Parameters

<i>Index</i>	Zero-based index of the system, a value ≥ 0 and $<$ number of systems, returned by the LvLibrary::GetNumberOfSystems() function.
<i>sSystemId</i>	String, where the system ID will be placed.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.13.2.13 static LvStatus LvLibrary::GetSystemIdSize (uint32_t Index, size_t * pSize) [static]

Returns the size of the string buffer needed to hold the system ID string, including the terminating zero character.

Parameters

<i>Index</i>	Zero-based index of the system, a value ≥ 0 and $<$ number of systems, returned by the <code>LvLibrary::GetNumberOfSystems()</code> function.
<i>pSize</i>	Size of the buffer is returned in this parameter.

Returns

Returns the `LvStatus` value indicating the success of the requested operation. See [LvStatus definitions](#).

5.13.2.14 `static uint32_t LvLibrary::GetVersion () [static]`

Returns SynView version.

Returns

The returned doubleword contains the build version in the low word and the high word is the major version in the upper byte and subversion in the lower byte. For example:

```
uint32_t Version = LvLibrary::GetVersion();
printf("SynView %d.%02d.%03d",
      ((Version >> 24) & 0xFF),
      ((Version >> 16) & 0xFF),
      (Version & 0xFFFF));
```

5.13.2.15 `static void LvLibrary::Log (const char * pLogMessage) [static]`

Adds a line to the `sv.synview.log`. The SynView log is a tool for New Electronic Technology technical support, but in some cases may be useful to put to the log additional info from your code.

Parameters

<i>pLogMessage</i>	Pointer to the null terminated string with the message.
--------------------	---

5.13.2.16 `static void LvLibrary::Logf (const char * pszFormat, ...) [static]`

Adds a line to the `sv.synview.log`. The SynView log is a tool for New Electronic Technology technical support, but in some cases may be useful to put to the log additional info from your code.

Parameters

<i>pszFormat</i>	Pointer to the null terminated string with the format string.
<i>...</i>	variable number of arguments.

5.13.2.17 `LvException::LvException (const char * pMessage, LvStatus Number) throw (`

constructor

5.13.2.18 `LvException::LvException (const LvException & e) throw (`

constructor

5.13.2.19 `const char* LvException::Message () throw (`

error message

5.13.2.20 `LvStatus LvException::Number () throw`

error status

5.13.2.21 `static LvStatus LvLibrary::OpenLibrary () [static]`

Opens the SynView library. This must be done before you can use any other SynView function (with the exception of `LvLibrary::GetVersion()` and `LvLibrary::GetErrorMessage()`). If you are using SynView in Windows DLL, avoid calling this in Windows DllMain() function - for proper functionality this function must be called when the application or DLL is already fully initialized and there are no restrictions about synchronization (DllMain has such restrictions). If you call this function multiple times, you must balance it by the same number of the `LvLibrary::CloseLibrary()` calls. Only the first call will actually do the initialization. IMPORTANT: The library must not be opened again once it was already uninitialized.

Returns

Returns the `LvStatus` value indicating the success of the requested operation. See [LvStatus definitions](#).

5.13.2.22 `static void LvLibrary::SetThrowErrorEnable (bool bEnable) [static]`

Enables/disables the conversion of `LvStatus` return values (not equal to `LVSTATUS_OK`) to C++ exceptions of the `LvException` type.

Parameters

<i>bEnable</i>	Enable/disable the exception throwing.
----------------	--

5.13.2.23 `static LvStatus LvLibrary::UpdateSystemList () [static]`

Updates the list of systems available. This function must be called before iterating through the systems by the `LvLibrary::GetNumberOfSystems()` and `LvLibrary::GetSystemId()` functions. The systems are physically represented by GenTL libraries available in the operating systems, this call searches for them in standard locations. See also the description of the sv.synview.ini file in the SynView User's Guide. Note that this function is seldom needed, most applications will work with the default system (see `LvSystem::Open()` for details).

Returns

Returns the `LvStatus` value indicating the success of the requested operation. See [LvStatus definitions](#).

5.14 LvSystem methods

Functions

- static [LvStatus LvSystem::Open](#) (const char *pSystemId, [LvSystem](#) *&pSystem)
- static [LvStatus LvSystem::Close](#) ([LvSystem](#) *&pSystem)
- [LvStatus LvSystem::UpdateInterfaceList](#) (uint32_t Timeout=0xFFFFFFFF)
- [LvStatus LvSystem::GetNumberOfInterfaces](#) (uint32_t *pNumberOfInterfaces)
- [LvStatus LvSystem::GetInterfaceId](#) (uint32_t Index, char *pInterfaceId, size_t Size)
- [LvStatus LvSystem::GetInterfaceIdSize](#) (uint32_t Index, size_t *pSize)
- [LvStatus LvSystem::GetInterfaceId](#) (uint32_t Index, std::string &sInterfaceId)
- [LvStatus LvSystem::FindInterface](#) ([LvFindBy](#) FindBy, const char *pFindStr, char *pInterfaceId, size_t Size)
- [LvStatus LvSystem::FindInterface](#) ([LvFindBy](#) FindBy, const char *pFindStr, std::string &sInterfaceId)
- [LvHSystem LvSystem::GetHandle](#) ()
- [LvStatus LvSystem::OpenInterface](#) (const char *pInterfaceId, [LvInterface](#) *&pInterface)
- [LvStatus LvSystem::CloseInterface](#) ([LvInterface](#) *&pInterface)
- [LvStatus LvSystem::OpenEvent](#) ([LvEventType](#) EventType, [LvEvent](#) *&pEvent)
- [LvStatus LvSystem::CloseEvent](#) ([LvEvent](#) *&pEvent)

5.14.1 Detailed Description

5.14.2 Function Documentation

5.14.2.1 static [LvStatus LvSystem::Close](#) ([LvSystem](#) *& pSystem) [static]

Deletes the [LvSystem](#) class instance. Actually it means freeing the corresponding GenTL library. Be sure you first close all dependent modules ([LvInterface](#), [LvEvent](#) etc.). If the System was opened multiple times, it only decreases the reference counter (see the note by the [LvSystem::Open\(\)](#)).

Parameters

<i>pSystem</i>	Pointer to LvSystem instance, obtained from the LvSystem::Open() function. The pointer is assigned NULL after the operation.
----------------	--

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.14.2.2 [LvStatus LvSystem::CloseEvent](#) ([LvEvent](#) *& pEvent)

Deletes the [LvEvent](#) class instance. This method is provided just for convenience, it has the same functionality as the [LvEvent::Close\(\)](#) static method.

Parameters

<i>pEvent</i>	Pointer the Event class instance, is assigned NULL after the closing is done.
---------------	---

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

See also

[LvEvent::Close\(\)](#).

5.14.2.3 LvStatus LvSystem::CloseInterface (LvInterface *& pInterface)

Deletes the [LvInterface](#) class instance. This method is provided just for convenience, it has the same functionality as the [LvInterface::Close\(\)](#) static method. If the Interface was opened multiple times, it only decreases the reference counter (see a note by the [LvInterface::Open\(\)](#)). Be sure you first close all dependent modules ([LvDevice](#), [LvEvent](#) etc.).

Parameters

<i>pInterface</i>	Pointer to the LvInterface instance, obtained from the LvInterface::Open() function. The pointer is assigned NULL after the operation.
-------------------	--

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

See also

[LvInterface::Close\(\)](#).

5.14.2.4 LvStatus LvSystem::FindInterface (LvFindBy FindBy, const char * pFindStr, char * pInterfaceld, size_t Size)

Finds the interface according specified criteria and returns a string ID of the interface, which is used by the [LvInterface::Open\(\)](#) function. This function does not update the interface list - if you need to do so, call the [LvSystem::UpdateInterfaceList\(\)](#) function before calling this function.

Parameters

<i>FindBy</i>	Specifies by which criteria to find the interface. Use one of the LvFindBy constants.
<i>pFindStr</i>	Specifies the find string, the meaning of which is determined by the FindBy parameter, for example when using the LvFindBy_IPAddress , this string should contain the IP address searched for. The searched string is not case sensitive and need not be complete (is searched as a substring).
<i>pInterfaceld</i>	Pointer to a string buffer, where the interface ID will be placed.
<i>Size</i>	Size of the string buffer.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#). If the Interface is found, the returned status is LVSTATUS_OK.

5.14.2.5 LvStatus LvSystem::FindInterface (LvFindBy FindBy, const char * pFindStr, std::string & sInterfaceld)

Finds the interface according specified criteria and returns a string ID of the interface, which is used by the [LvInterface::Open\(\)](#) function. This function does not update the interface list - if you need to do so, call the [LvSystem::UpdateInterfaceList\(\)](#) function before calling this function.

Parameters

<i>FindBy</i>	Specifies by which criteria to find the interface. Use one of the LvFindBy constants.
<i>pFindStr</i>	Specifies the find string, the meaning of which is determined by the FindBy parameter, for example when using the LvFindBy_IPAddress , this string should contain the IP address searched for. The searched string is not case sensitive and need not be complete (is searched as a substring).

<i>sInterfaceld</i>	String to which the interface ID will be placed.
---------------------	--

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#). If the Interface is found, the returned status is LVSTATUS_OK.

5.14.2.6 LvHSystem LvSystem::GetHandle ()

Returns a handle of the System (used in the Plain C API), associated with this class.

Returns

The Plain C API handle.

5.14.2.7 LvStatus LvSystem::GetInterfaceld (uint32_t Index, char * pInterfaceld, size_t Size)

Returns a string ID of the interface, which is used by the [LvInterface::Open\(\)](#) function.

Parameters

<i>Index</i>	Zero-based index of the interface, a value ≥ 0 and $<$ number of interfaces, returned by the LvSystem::GetNumberOfInterfaces() function.
<i>pInterfaceld</i>	Pointer to a string buffer, where the interface ID will be placed.
<i>Size</i>	Size of the string buffer.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.14.2.8 LvStatus LvSystem::GetInterfaceld (uint32_t Index, std::string & sInterfaceld)

Returns a string ID of the interface, which is used by the [LvInterface::Open\(\)](#) function.

Parameters

<i>Index</i>	Zero-based index of the interface, a value ≥ 0 and $<$ number of interfaces, returned by the LvSystem::GetNumberOfInterfaces() function.
<i>sInterfaceld</i>	String, where the interface ID will be placed.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.14.2.9 LvStatus LvSystem::GetInterfaceldSize (uint32_t Index, size_t * pSize)

Returns the size of the string buffer needed to hold the Interface ID string, including the terminating zero character.

Parameters

<i>Index</i>	Zero-based index of the interface, a value ≥ 0 and $<$ number of interfaces, returned by the LvSystem::GetNumberOfInterfaces() function.
<i>pSize</i>	Size of the buffer is returned in this parameter.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.14.2.10 [LvStatus](#) LvSystem::GetNumberOfInterfaces ([uint32_t](#) * *pNumberOfInterfaces*)

Returns the number of found interfaces, after the [LvSystem::UpdateInterfaceList\(\)](#) call.

Parameters

<i>pNumberOfInterfaces</i>	Number of interfaces found.
----------------------------	-----------------------------

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.14.2.11 `static LvStatus LvSystem::Open (const char * pSystemId, LvSystem *& pSystem)` [static]

Creates the [LvSystem](#) class instance. Opening the system actually means loading the corresponding GenT↔L library. Note that before you can open the System, the [LvOpenLibrary\(\)](#) must be called. The same system can be open multiple times (there is a reference counter inside); in such case there must be also the same number of [LvSystem::Close\(\)](#) calls used (every open increase the reference count and every close decreases it).

Parameters

<i>pSystemId</i>	A string ID of the system. This can be either an empty string - then the default system is opened, or it can be a string obtained from the LvGetSystemId() function.
<i>pSystem</i>	Pointer to the opened LvSystem instance is returned here in case the opening succeeds, NULL if fails

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.14.2.12 [LvStatus](#) LvSystem::OpenEvent ([LvEventType](#) *EventType*, [LvEvent](#) *& *pEvent*)

Creates the [LvEvent](#) class instance, owned by the System. This method is provided just for convenience, it has the same functionality as the [LvEvent::Open\(\)](#) static method.

Parameters

<i>EventType</i>	One of the LvEventType .
<i>pEvent</i>	To this parameter the Event class instance is stored.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

See also

[LvEvent::Open\(\)](#).

5.14.2.13 `LvStatus LvSystem::OpenInterface (const char * pInterfaceId, LvInterface *& pInterface)`

Creates the `LvInterface` class instance. This method is provided just for convenience, it has the same functionality as the `LvInterface::Open()` static method. The same Interface can be open multiple times (there is a reference counter inside); in such case there must be also the same number of `LvInterface::Close()` or `LvSystem::InterfaceClose()` calls used (every open increase the reference count and every close decreases it).

Parameters

<i>pInterfaceId</i>	A string interface ID, obtained by the <code>LvSystem::GetInterfaceId()</code> .
<i>pInterface</i>	In this parameter the pointer to the <code>LvInterface</code> instance is returned.

Returns

Returns the `LvStatus` value indicating the success of the requested operation. See [LvStatus definitions](#).

See also

[LvInterface::Open\(\)](#).

5.14.2.14 `LvStatus LvSystem::UpdateInterfaceList (uint32_t Timeout = 0xFFFFFFFF)`

Updates the internal list of available interfaces. You can then iterate through them by `LvSystem::GetNumberOfInterfaces()` and `LvSystem::GetInterfaceId()`.

Parameters

<i>Timeout</i>	Specifies a timeout in ms for searching the interfaces. This applies only to special cases of interfaces, where some delay can happen; common interfaces are detected without any significant delays.
----------------	---

Returns

If the timeout has expired while waiting for the completion, the function returns `LVSTATUS_TIMEOUT`, otherwise it returns the `LvStatus` value indicating the success of the requested operation. See [LvStatus definitions](#).

5.15 LvInterface methods

Functions

- static [LvStatus LvInterface::Open](#) ([LvSystem](#) *pSystem, const char *pInterfaceld, [LvInterface](#) *&pInterface)
- static [LvStatus LvInterface::Close](#) ([LvInterface](#) *&pInterface)
- [LvStatus LvInterface::UpdateDeviceList](#) (uint32_t Timeout=0xFFFFFFFF)
- [LvStatus LvInterface::GetNumberOfDevices](#) (uint32_t *pDevices)
- [LvStatus LvInterface::GetDeviceld](#) (uint32_t Index, char *pDeviceld, size_t Size)
- [LvStatus LvInterface::GetDeviceldSize](#) (uint32_t Index, size_t *pSize)
- [LvStatus LvInterface::GetDeviceld](#) (uint32_t Index, std::string &sDeviceld)
- [LvStatus LvInterface::FindDevice](#) ([LvFindBy](#) FindBy, const char *pFindStr, char *pDeviceld, size_t Size)
- [LvStatus LvInterface::FindDevice](#) ([LvFindBy](#) FindBy, const char *pFindStr, std::string &sDeviceld)
- [LvHInterface LvInterface::GetHandle](#) ()
- [LvStatus LvInterface::OpenDevice](#) (const char *pDeviceld, [LvDevice](#) *&pDevice, [LvDeviceAccess](#) Access=[LvDeviceAccess_Exclusive](#))
- [LvStatus LvInterface::CloseDevice](#) ([LvDevice](#) *&pDevice)

5.15.1 Detailed Description

5.15.2 Function Documentation

5.15.2.1 static [LvStatus LvInterface::Close](#) ([LvInterface](#) *& *pInterface*) [static]

Deletes the [LvInterface](#) class instance. If the Interface was opened multiple times, it only decreases the reference counter (see a note by the [LvInterface::Open\(\)](#)). Be sure you first close all dependent modules ([LvDevice](#), [LvEvent](#) etc.).

Parameters

<i>pInterface</i>	Pointer to the LvInterface instance, obtained from the LvInterface::Open() function. The pointer is assigned NULL after the operation.
-------------------	--

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

See also

[LvSystem::CloseInterface\(\)](#).

5.15.2.2 [LvStatus LvInterface::CloseDevice](#) ([LvDevice](#) *& *pDevice*)

Deletes the [LvDevice](#) class instance. This method is provided just for convenience, it has the same functionality as the [LvDevice::Close\(\)](#) static method. Be sure you first close all dependent modules ([LvStream](#), [LvEvent](#) etc.).

Parameters

<i>pDevice</i>	Pointer to the LvDevice instance, obtained from the LvDevice::Open() function. This pointer is assigned NULL after the operation.
----------------	---

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

See also

[LvDevice::Close\(\)](#).

5.15.2.3 `LvStatus LvInterface::FindDevice (LvFindBy FindBy, const char * pFindStr, char * pDeviceld, size_t Size)`

Finds the device according specified criteria and returns a string ID of the device, which can be used by the [LvDevice::Open\(\)](#) function. This function does not update the device list - if you need to do so, call the [LvInterface::UpdateDeviceList\(\)](#) function before calling this function.

Parameters

<i>FindBy</i>	Specifies by which criteria to find the interface. Use one of the LvFindBy constants.
<i>pFindStr</i>	Specifies the find string, the meaning of which is determined by the FindBy parameter, for example when using the LvFindBy_IPAddress , this string should contain the IP address searched for. The searched string is not case sensitive and need not be complete (is searched as a substring).
<i>pDeviceld</i>	Pointer to a string buffer, where the device ID will be placed.
<i>Size</i>	Size of the buffer.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#). If the Device is found, the returned status is `LVSTATUS_OK`.

5.15.2.4 `LvStatus LvInterface::FindDevice (LvFindBy FindBy, const char * pFindStr, std::string & sDeviceld)`

Finds the device according specified criteria and returns a string ID of the device, which can be used by the [LvDevice::Open\(\)](#) function. This function does not update the device list - if you need to do so, call the [LvInterface::UpdateDeviceList\(\)](#) function before calling this function.

Parameters

<i>FindBy</i>	Specifies by which criteria to find the interface. Use one of the LvFindBy constants.
<i>pFindStr</i>	Specifies the find string, the meaning of which is determined by the FindBy parameter, for example when using the LvFindBy_IPAddress , this string should contain the IP address searched for. The searched string is not case sensitive and need not be complete (is searched as a substring).
<i>sDeviceld</i>	To this string the found device ID is placed.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#). If the Device is found, the returned status is `LVSTATUS_OK`.

5.15.2.5 `LvStatus LvInterface::GetDeviceld (uint32_t Index, char * pDeviceld, size_t Size)`

Returns a string ID of the device at specified position in the list. Note that this device ID is stable (the same physical device has always the same ID) and it is unique (no other physical device can have the same ID). To hardcode directly the device ID in your application is not recommended, as the application would not be usable, when a defective device needs to be replaced. The SynView User's Guide discuss the ways, how to solve such maintainability demands.

Parameters

<i>Index</i>	Zero-based index of the device, a value ≥ 0 and $<$ number of devices, returned by the LvInterface::GetNumberOfDevices() function.
--------------	---

<i>pDeviceId</i>	Pointer to a string buffer, where the device ID will be placed.
<i>Size</i>	Size of the buffer.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.15.2.6 LvStatus LvInterface::GetDeviceId (uint32_t Index, std::string & sDeviceId)

Returns a string ID of the device at specified position in the list. Note that this device ID is stable (the same physical device has always the same ID) and it is unique (no other physical device can have the same ID). To hardcode directly the device ID in your application is not recommended, as the application would not be usable, when a defective device needs to be replaced. The SynView User's Guide discuss the ways, how to solve such maintainability demands.

Parameters

<i>Index</i>	Zero-based index of the device, a value ≥ 0 and $<$ number of devices, returned by the LvInterface::GetNumberOfDevices() function.
<i>sDeviceId</i>	String to which the device ID will be placed.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.15.2.7 LvStatus LvInterface::GetDeviceIdSize (uint32_t Index, size_t * pSize)

Returns the size of the string buffer needed to hold the Device ID string, including the terminating zero character.

Parameters

<i>Index</i>	Zero-based index of the device, a value ≥ 0 and $<$ number of devices, returned by the LvInterface::GetNumberOfDevices() function.
<i>pSize</i>	Size of the buffer is returned in this parameter.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.15.2.8 LvHInterface LvInterface::GetHandle ()

Returns a handle of the Interface (used in the Plain C API), associated with this class.

Returns

The Plain C API handle.

5.15.2.9 LvStatus LvInterface::GetNumberOfDevices (uint32_t * pDevices)

Returns the number of devices found by the [LvInterface::UpdateDeviceList\(\)](#) function.

Parameters

<i>pDevices</i>	Number of devices found.
-----------------	--------------------------

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.15.2.10 `static LvStatus LvInterface::Open (LvSystem * pSystem, const char * pInterfaceId, LvInterface *& pInterface) [static]`

Creates the [LvInterface](#) class instance. The same Interface can be open multiple times (there is a reference counter inside); in such case there must be also the same number of [LvInterface::Close\(\)](#) or [LvSystem::InterfaceClose\(\)](#) calls used (every open increase the reference count and every close decreases it) .

Parameters

<i>pSystem</i>	A pointer to the LvSystem instance, obtained from the LvSystem::Open() function.
<i>pInterfaceId</i>	A string interface ID, obtained by the LvSystem::GetInterfaceId() .
<i>pInterface</i>	In this parameter the pointer to the LvInterface instance is returned.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

See also

[LvSystem::OpenInterface\(\)](#).

5.15.2.11 `LvStatus LvInterface::OpenDevice (const char * pDeviceId, LvDevice *& pDevice, LvDeviceAccess Access = LvDeviceAccess_Exclusive)`

Creates the [LvDevice](#) class instance. This method is provided just for convenience, it has the same functionality as the [LvDevice::Open\(\)](#) static method. This physically means opening a connection with the device and retrieving a list of device remote features. Always check the success of this function call; the opening may fail for example when you request an exclusive access and the device is already open by some other application.

Parameters

<i>pDeviceId</i>	A string ID of the device, obtained by LvInterface::GetDeviceId() function.
<i>pDevice</i>	In this parameter the pointer to the LvDevice instance is returned.
<i>Access</i>	Desired device access, one of the LvDeviceAccess constants.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

See also

[LvDevice::Open\(\)](#).

5.15.2.12 `LvStatus LvInterface::UpdateDeviceList (uint32_t Timeout = 0xFFFFFFFF)`

Updates the Device list. The available devices are searched.

Parameters

<i>Timeout</i>	Specifies a timeout in ms for searching the devices.
----------------	--

Returns

If the timeout has expired while waiting for the completion, the function returns [LVSTATUS_TIMEOUT](#), otherwise it returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.16 LvDevice methods

Modules

- [LvDevice firmware update methods](#)

Functions

- static `LvStatus LvDevice::Open` (`LvInterface` *pInterface, const char *pDeviceId, `LvDevice` *&pDevice, `LvDeviceAccess` Access=`LvDeviceAccess_Exclusive`)
- static `LvStatus LvDevice::Close` (`LvDevice` *&pDevice)
- `LvStatus LvDevice::GetNumberOfStreams` (uint32_t *pNumberOfStreams)
- `LvStatus LvDevice::GetStreamId` (uint32_t Index, char *pStreamId, size_t Size)
- `LvStatus LvDevice::GetStreamIdSize` (uint32_t Index, size_t *pSize)
- `LvStatus LvDevice::GetStreamId` (uint32_t Index, std::string &sStreamId)
- `LvStatus LvDevice::AcquisitionStart` (uint32_t Options=0)
- `LvStatus LvDevice::AcquisitionStop` (uint32_t Options=0)
- `LvStatus LvDevice::AcquisitionAbort` (uint32_t Options=0)
- `LvStatus LvDevice::AcquisitionArm` (uint32_t Options=0)
- `LvStatus LvDevice::SaveSettings` (const char *pId, const char *pFileName, uint32_t Options)
- `LvStatus LvDevice::LoadSettings` (const char *pId, const char *pFileName, uint32_t Options)
- `LvStatus LvDevice::UniSetLut` (`LvLUTSelector` Selector, void *pLUT, size_t Size, uint32_t Options=0)
- `LvStatus LvDevice::UniGetLut` (`LvLUTSelector` Selector, void *pLUT, size_t Size, uint32_t Options=0)
- `LvStatus LvDevice::OpenStream` (const char *pStreamId, `LvStream` *&pStream)
- `LvStatus LvDevice::CloseStream` (`LvStream` *&pStream)
- `LvStatus LvDevice::OpenEvent` (`LvEventType` EventType, `LvEvent` *&pEvent)
- `LvStatus LvDevice::CloseEvent` (`LvEvent` *&pEvent)
- `LvHDevice LvDevice::GetHandle` ()

5.16.1 Detailed Description

5.16.2 Function Documentation

5.16.2.1 `LvStatus LvDevice::AcquisitionAbort` (uint32_t *Options* = 0)

Aborts the acquisition immediately, without completing the current Frame or waiting on a trigger.

Parameters

<i>Options</i>	Reserved for future use, must be 0 or omitted.
----------------	--

Returns

Returns the `LvStatus` value indicating the success of the requested operation. See [LvStatus definitions](#).

5.16.2.2 `LvStatus LvDevice::AcquisitionArm` (uint32_t *Options* = 0)

Prepares the device for acquisition, so that the acquisition using the `LvDevice::AcquisitionStart()` function then can start fast. If it is not called before `LvDevice::AcquisitionStart()`, it is called automatically inside the `LvDevice::AcquisitionStart()`.

Parameters

<i>Options</i>	Reserved for future use, must be 0 or omitted.
----------------	--

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.16.2.3 **LvStatus** LvDevice::AcquisitionStart (uint32_t *Options* = 0)

Starts the acquisition. This function includes more than just calling the remote AcquisitionStart command on the device - it checks the size of the buffers, prepares the streams for the start, locks GenTL params and then starts the acquisition on the device itself. Always check the success of this function call.

Parameters

<i>Options</i>	Reserved for future use, must be 0 or omitted.
----------------	--

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.16.2.4 **LvStatus** LvDevice::AcquisitionStop (uint32_t *Options* = 0)

Stops the acquisition.

Parameters

<i>Options</i>	Reserved for future use, must be 0 or omitted.
----------------	--

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.16.2.5 **static LvStatus** LvDevice::Close (LvDevice *& *pDevice*) [static]

Deletes the [LvDevice](#) class instance. Be sure you first close all dependent modules ([LvStream](#), [LvEvent](#) etc.).

Parameters

<i>pDevice</i>	Pointer to the LvDevice instance, obtained from the LvDevice::Open() function. This pointer is assigned NULL after the operation.
----------------	---

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

See also

[LvInterface::CloseDevice\(\)](#).

5.16.2.6 **LvStatus** LvDevice::CloseEvent (LvEvent *& *pEvent*)

Deletes the [LvEvent](#) class instance. This method is provided just for convenience, it has the same functionality as the [LvEvent::Close\(\)](#) static method.

Parameters

<i>pEvent</i>	A pointer to the LvEvent class instance, obtained from the LvEvent::Open() or LvDevice::↔OpenEvent() function. This pointer is assigned NULL after the operation.
---------------	---

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

See also

[LvEvent::Close\(\)](#).

5.16.2.7 LvStatus LvDevice::CloseStream (LvStream * & pStream)

Deletes the [LvStream](#) class instance. This method is provided just for convenience, it has the same functionality as the [LvStream::Close\(\)](#) static method. Be sure you first close all dependent modules ([LvBuffers](#), [LvEvent](#), [Lv↔Renderer](#) etc.).

Parameters

<i>pStream</i>	Pointer to the LvStream instance, obtained from the LvStream::Open() or LvDevice::Open↔Stream() function. This pointer is assigned NULL after the operation.
----------------	--

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

See also

[LvStream::Close\(\)](#).

5.16.2.8 LvHDevice LvDevice::GetHandle ()

Returns a handle of the Device (used in the Plain C API), associated with this class.

Returns

The Plain C API handle.

5.16.2.9 LvStatus LvDevice::GetNumberOfStreams (uint32_t * pNumberOfStreams)

Returns the number of available stream types for this device. You can then iterate the streams by the [LvDevice::↔GetStreamId\(\)](#) function.

Parameters

<i>pNumberOf↔Streams</i>	The number of streams is returned here.
--------------------------	---

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.16.2.10 LvStatus LvDevice::GetStreamId (uint32_t Index, char * pStreamId, size_t Size)

Returns a string Stream ID, needed for opening the stream.

Parameters

<i>Index</i>	Zero-based index of the stream type, a value ≥ 0 and $<$ number of streams, returned by the LvDevice::GetNumberOfStreams() function.
<i>pStreamId</i>	Pointer to a string buffer, where the stream ID will be placed.
<i>Size</i>	Size of the buffer.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.16.2.11 `LvStatus LvDevice::GetStreamId (uint32_t Index, std::string & sStreamId)`

Returns a string Stream ID, needed for opening the stream.

Parameters

<i>Index</i>	Zero-based index of the stream type, a value ≥ 0 and $<$ number of streams, returned by the LvDevice::GetNumberOfStreams() function.
<i>sStreamId</i>	A string to which the stream ID is placed.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.16.2.12 `LvStatus LvDevice::GetStreamIdSize (uint32_t Index, size_t * pSize)`

Returns the size of the string buffer needed to hold the stream ID at given index, including the space for the terminating zero character.

Parameters

<i>Index</i>	Zero-based index of the stream type, a value ≥ 0 and $<$ number of streams, returned by the LvDevice::GetNumberOfStreams() function.
<i>pSize</i>	Size of the buffer is returned in this parameter.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.16.2.13 `LvStatus LvDevice::LoadSettings (const char * pId, const char * pFileName, uint32_t Options)`

Loads the device settings from a file. In the Options can be specified which parts of the device configuration are to be loaded.

Parameters

<i>pId</i>	A string ID enabling to distinguish more configurations in one file. If empty, the "Default" will be used.
<i>pFileName</i>	The file specification, where the configuration is stored. It is a text file.
<i>Options</i>	One or or-ed combination of LvSaveFlag definitions .

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.16.2.14 `static LvStatus LvDevice::Open (LvInterface * pInterface, const char * pDeviceId, LvDevice *& pDevice, LvDeviceAccess Access = LvDeviceAccess_Exclusive) [static]`

Creates the [LvDevice](#) class instance.

This physically means opening a connection with the device and retrieving a list of device remote features. Always check the success of this function call; the opening may fail for example when you request an exclusive access and the device is already open by some other application.

Parameters

<i>pInterface</i>	A pointer to the LvInterface instance, obtained from the LvInterface::Open() function.
<i>pDeviceId</i>	A string ID of the device, obtained by LvInterface::GetDeviceId() function.
<i>pDevice</i>	In this parameter the pointer to the LvDevice instance is returned.
<i>Access</i>	Desired device access, one of the LvDeviceAccess constants.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

See also

[LvInterface::OpenDevice\(\)](#).

5.16.2.15 `LvStatus LvDevice::OpenEvent (LvEventType EventType, LvEvent *& pEvent)`

Creates the [LvEvent](#) class instance for specified owner module. This method is provided just for convenience, it has the same functionality as the [LvEvent::Open\(\)](#) static method.

Parameters

<i>EventType</i>	One of the LvEventType .
<i>pEvent</i>	To this parameter the pointer LvEvent instance is stored.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

See also

[LvEvent::Open\(\)](#).

5.16.2.16 `LvStatus LvDevice::OpenStream (const char * pStreamId, LvStream *& pStream)`

Creates the [LvStream](#) class instance associated with the device. This method is provided just for convenience, it has the same functionality as the [LvStream::Open\(\)](#) static method.

Parameters

<i>pStreamId</i>	A string ID of the stream, obtained from LvDevice::GetStreamId() . If an empty string is used, the first found stream is opened. This is usually the image data stream.
<i>pStream</i>	In this parameter the pointer to the LvStream instance is returned.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

See also

[LvStream::Open\(\)](#).

5.16.2.17 LvStatus LvDevice::SaveSettings (const char * *pId*, const char * *pFileName*, uint32_t *Options*)

Saves the device settings to a file. In the Options can be specified which parts of the device configuration are to be saved.

Parameters

<i>pId</i>	A string ID enabling to distinguish more configurations in one file. If empty, the "Default" will be used.
<i>pFileName</i>	The file specification, to which the configuration is stored. It is a text file.
<i>Options</i>	One or or-ed combination of LvSaveFlag definitions .

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.16.2.18 LvStatus LvDevice::UniGetLut (LvLUTSelector *Selector*, void * *pLUT*, size_t *Size*, uint32_t *Options* = 0)

Gets the lookup table. See [LvDevice::UniSetLut\(\)](#) for details. The LUT is automatically recalculated to appropriate type, if you use different LUT bit depth than is the actually used for the current pixel format. So you can for example read the 12-bit LUT to 8-bit LUT array.

Parameters

<i>Selector</i>	Lookup table selector, see LvLUTSelector .
<i>pLUT</i>	Pointer to the lookup table.
<i>Size</i>	Size of the lookup table. The only valid values are <ul style="list-style-type: none"> • 256 for 8-bit LUT • 2048 for 10-bit LUT • 8192 for 12-bit LUT
<i>Options</i>	The LvUniLutFlags_HwLut option can be used to apply to function directly on HW LUT.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.16.2.19 LvStatus LvDevice::UniSetLut (LvLUTSelector *Selector*, void * *pLUT*, size_t *Size*, uint32_t *Options* = 0)

Sets the lookup table. If the hardware lookup table is available, it is used, otherwise a software lookup table is set. This function belongs to a set of functions, which unify the functionality of devices with real-time processing embedded in hardware (RTF) and devices without real-time processing, for which the processing is made by software. The LUT is automatically recalculated to appropriate type, if you use different LUT bit depth than is the actually used for the current pixel format.

Parameters

<i>Selector</i>	Lookup table selector, see LvLUTSelector .
<i>pLUT</i>	Pointer to the lookup table.
<i>Size</i>	Size of the lookup table. The only valid values are <ul style="list-style-type: none"> • 256 for 8-bit LUT • 2048 for 10-bit LUT • 8192 for 12-bit LUT
<i>Options</i>	The LvUniLutFlags_HwLut option can be used to apply to function directly on HW LUT.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.17 LvDevice firmware update methods

Functions

- [LvStatus LvDevice::FwGetFilePattern](#) (uint32_t Which, char *pFilePattern, size_t Size)
- [LvStatus LvDevice::FwLoad](#) (uint32_t Which, const char *pFilePath)
- [LvStatus LvDevice::FwGetLoadStatus](#) (uint32_t Which, uint32_t *pCurrentByteCount, bool *plsLoading)

5.17.1 Detailed Description

5.17.2 Function Documentation

5.17.2.1 LvStatus LvDevice::FwGetFilePattern (uint32_t Which, char * pFilePattern, size_t Size)

Returns the file name mask (with wildcard characters), for searching the file with the appropriate firmware update. The files with the FW update have in their names coded the hardware IDs, so using this mask (for example in a filter in a file open dialog box) assures the file appropriate for this device is used.

Parameters

<i>Which</i>	An ID specific for a hardware. Discussed in the SynView User's Guide.
<i>pFilePattern</i>	In this parameter the file pattern is returned.
<i>Size</i>	Size of the buffer (to which the pFilePattern points).

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.17.2.2 LvStatus LvDevice::FwGetLoadStatus (uint32_t Which, uint32_t * pCurrentByteCount, bool * plsLoading)

Returns the byte count and whether the loading is still in progress.

Parameters

<i>Which</i>	An ID specific for a hardware. Discussed in the SynView User's Guide.
<i>pCurrentByteCount</i>	Returns number of bytes transferred so far.
<i>plsLoading</i>	Returns true if the loading is still in progress.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.17.2.3 LvStatus LvDevice::FwLoad (uint32_t Which, const char * pFilePath)

Loads the firmware from a file to the hardware. It can be very long process (taking minutes) and this functions blocks the thread during this process. It is recommended to check the load status from another thread using the [LvFwGetLoadStatus\(\)](#) function.

Parameters

<i>Which</i>	An ID specific for a hardware. Discussed in the SynView User's Guide.
--------------	---

<i>pFilePath</i>	File specification, with full path.
------------------	-------------------------------------

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.18 LvStream methods

Functions

- static [LvStatus](#) [LvStream::Open](#) ([LvDevice](#) *pDevice, const char *pStreamId, [LvStream](#) *&pStream)
- static [LvStatus](#) [LvStream::Close](#) ([LvStream](#) *&pStream)
- [LvStatus](#) [LvStream::GetBufferAt](#) (uint32_t BufferIndex, [LvBuffer](#) *&pBuffer)
- [LvStatus](#) [LvStream::FlushQueue](#) ([LvQueueOperation](#) Operation)
- [LvStatus](#) [LvStream::Start](#) (uint32_t StartFlags=0x00000000, uint32_t ImagesToAcquire=0xFFFFFFFF)
- [LvStatus](#) [LvStream::Stop](#) (uint32_t StopFlags=0x00000000)
- [LvHStream](#) [LvStream::GetHandle](#) ()
- [LvStatus](#) [LvStream::OpenBuffer](#) (void *pDataPointer, size_t DataSize, void *pUserPointer, uint32_t Options, [LvBuffer](#) *&pBuffer)
- [LvStatus](#) [LvStream::CloseBuffer](#) ([LvBuffer](#) *&pBuffer)
- [LvStatus](#) [LvStream::OpenEvent](#) ([LvEventType](#) EventType, [LvEvent](#) *&pEvent)
- [LvStatus](#) [LvStream::CloseEvent](#) ([LvEvent](#) *&pEvent)
- [LvStatus](#) [LvStream::OpenRenderer](#) ([LvRenderer](#) *&pRenderer)
- [LvStatus](#) [LvStream::CloseRenderer](#) ([LvRenderer](#) *&pRenderer)

5.18.1 Detailed Description

5.18.2 Function Documentation

5.18.2.1 static [LvStatus](#) [LvStream::Close](#) ([LvStream](#) *& pStream) [static]

Deletes the [LvStream](#) class instance. Be sure you first close all dependent modules ([LvBuffers](#), [LvEvent](#), [LvRenderer](#) etc.).

Parameters

<i>pStream</i>	Pointer to the LvStream instance, obtained from the LvStream::Open() function. This pointer is assigned NULL after the operation.
----------------	---

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

See also

[LvDevice::CloseStream\(\)](#).

5.18.2.2 [LvStatus](#) [LvStream::CloseBuffer](#) ([LvBuffer](#) *& pBuffer)

Deletes the [LvBuffer](#) class instance. On the GenTL level it corresponds to the [DSRevokeBuffer\(\)](#) function. This method is provided just for convenience, it has the same functionality as the [LvBuffer::Close\(\)](#) static method.

Parameters

<i>pBuffer</i>	A pointer to the LvBuffer instance, obtained from the LvBuffer::Open() function. This pointer is assigned NULL after the operation.
----------------	---

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

See also

[LvBuffer::Close\(\)](#).

5.18.2.3 LvStatus LvStream::CloseEvent (LvEvent *& pEvent)

Deletes the [LvEvent](#) class instance. This method is provided just for convenience, it has the same functionality as the [LvEvent::Close\(\)](#) static method.

Parameters

<i>pEvent</i>	Pointer the Event class instance, is assigned NULL after the closing is done.
---------------	---

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

See also

[LvEvent::Close\(\)](#).

5.18.2.4 LvStatus LvStream::CloseRenderer (LvRenderer *& pRenderer)

Deletes the [LvRenderer](#) class instance. This method is provided just for convenience, it has the same functionality as the [LvRenderer::Close\(\)](#) static method.

Parameters

<i>pRenderer</i>	A pointer to the LvRenderer instance, obtained from the LvRenderer::Open() function. This pointer is set to NULL after close.
------------------	---

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

See also

[LvRenderer::Close\(\)](#).

5.18.2.5 LvStatus LvStream::FlushQueue (LvQueueOperation Operation)

Moves the buffers according to the [LvQueueOperation](#) specified.

Parameters

<i>Operation</i>	One of the LvQueueOperation .
------------------	---

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.18.2.6 LvStatus LvStream::GetBufferAt (uint32_t BufferIndex, LvBuffer *& pBuffer)

Returns the buffer instance at given index.

Parameters

<i>BufferIndex</i>	Zero-based index.
<i>pBuffer</i>	In this parameter the pointer to LvBuffer instance is returned.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.18.2.7 [LvHStream](#) [LvStream::GetHandle](#) ()

Returns a handle of the Stream (used in the Plain C API), associated with this class.

Returns

The Plain C API handle.

5.18.2.8 `static LvStatus LvStream::Open (LvDevice * pDevice, const char * pStreamId, LvStream *& pStream)`
[static]

Creates the [LvStream](#) class instance, associated with the device.

Parameters

<i>pDevice</i>	A pointer to the LvDevice instance, obtained from the LvDevice::Open() function.
<i>pStreamId</i>	A string ID of the stream, obtained from LvDevice::GetStreamId() . If an empty string is used, the first found stream is opened. This is usually the image data stream.
<i>pStream</i>	In this parameter the pointer to the LvStream instance is returned.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

See also

[LvDevice::OpenStream\(\)](#).

5.18.2.9 `LvStatus LvStream::OpenBuffer (void * pDataPointer, size_t DataSize, void * pUserPointer, uint32_t Options, LvBuffer *& pBuffer)`

Creates the [LvBuffer](#) class instance. On the GenTL level it corresponds to [DSAnnounceBuffer\(\)](#) or [DSAllocAndAnnounceBuffer\(\)](#). This method is provided just for convenience, it has the same functionality as the [LvBuffer::Open\(\)](#) static method.

Parameters

<i>pDataPointer</i>	Pointer to image data buffer. This can be supplied by the application (in such case the DataSize must be set to the actual size of the buffer), or can be left NULL - in such case the buffer is allocated by SynView .
---------------------	---

<i>DataSize</i>	Size of the buffer supplied, or 0 if the <i>pDataPointer</i> is NULL.
<i>pUserPointer</i>	A user pointer, which is then passed back in the LvEventCallbackNewBufferFunct() . It enables the application to reference some own data structure associated with the buffer.
<i>Options</i>	Currently unused, must be 0.
<i>pBuffer</i>	To this parameter the pointer to the LvBuffer instance is returned.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

See also

[LvBuffer::Open\(\)](#).

5.18.2.10 LvStatus LvStream::OpenEvent (LvEventType EventType, LvEvent *& pEvent)

Creates the [LvEvent](#) class instance, owned by the Stream. This method is provided just for convenience, it has the same functionality as the [LvEvent::Open\(\)](#) static method.

Parameters

<i>EventType</i>	One of the LvEventType .
<i>pEvent</i>	To this parameter the Event class instance is stored.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

See also

[LvEvent::Open\(\)](#).

5.18.2.11 LvStatus LvStream::OpenRenderer (LvRenderer *& pRenderer)

Creates the [LvRenderer](#) class instance for image display. The renderer attempts to load the `sv.synview.display` library. In case of SynView installation in an operating system without possibility to graphically display (for example Linux without XWindows), the load of this library fails and the calls to [Renderer](#) functions will return errors. This method is provided just for convenience, it has the same functionality as the [LvRenderer::Open\(\)](#) static method.

Parameters

<i>pRenderer</i>	In this parameter the pointer to the LvRenderer is returned.
------------------	--

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

See also

[LvRenderer::Open\(\)](#).

5.18.2.12 LvStatus LvStream::Start (uint32_t StartFlags = 0x00000000, uint32_t ImagesToAcquire = 0xFFFFFFFF)

Starts the stream. This function need not be used on the image stream, where it is called automatically in the [LvDevice::AcquisitionStart\(\)](#) function.

Parameters

<i>StartFlags</i>	One of the GroupSynview_StreamStartFlags.
<i>ImagesToAcquire</i>	Number of images to acquire.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.18.2.13 LvStatus LvStream::Stop (uint32_t StopFlags = 0x00000000)

Stops the stream. This function need not be used on the image stream, where it is called automatically in the [LvDevice::AcquisitionStop\(\)](#) function.

Parameters

<i>StopFlags</i>	One of the GroupSynview_StreamStopFlags.
------------------	--

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.19 LvBuffer methods

Functions

- static [LvStatus LvBuffer::Open](#) ([LvStream](#) *pStream, void *pDataPointer, size_t DataSize, void *pUser←→ Pointer, uint32_t Options, [LvBuffer](#) *&pBuffer)
- static [LvStatus LvBuffer::Close](#) ([LvBuffer](#) *&pBuffer)
- [LvStatus LvBuffer::AttachProcessBuffer](#) (void *pDataPointer, size_t DataSize)

- [LvStatus LvBuffer::SaveImageToTifFile](#) (const char *pFileName, uint32_t Options=0)
- [LvStatus LvBuffer::GetImgInfo](#) ([LviImgInfo](#) &ImgInfo, uint32_t Options=0)
- [LvStatus LvBuffer::GetLastPaintRect](#) (int32_t *pX, int32_t *pY, int32_t *pWidth, int32_t *pHeight)
- [LvStatus LvBuffer::UniCalculateWhiteBalance](#) ()
- [LvHBuffer LvBuffer::GetHandle](#) ()
- void * [LvBuffer::GetUserPtr](#) ()

5.19.1 Detailed Description

5.19.2 Function Documentation

5.19.2.1 [LvStatus LvBuffer::AttachProcessBuffer](#) (void * *pDataPointer*, size_t *DataSize*)

Attaches a process buffer to a buffer. The process buffer may be needed for software processing, for example Bayer decoding, if the device hardware is not capable of it. The process buffer can be either supplied by the application by this function, or allocated automatically by SynView, upon need.

Parameters

<i>pDataPointer</i>	Pointer to the supplied buffer.
<i>DataSize</i>	Size of the buffer.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.19.2.2 [static LvStatus LvBuffer::Close](#) ([LvBuffer](#) *& *pBuffer*) [static]

Deletes the [LvBuffer](#) class instance. On the GenTL level it corresponds to the DSRevokeBuffer() function.

Parameters

<i>pBuffer</i>	A pointer to the LvBuffer instance, obtained from the LvBuffer::Open() function. This pointer is assigned NULL after the operation.
----------------	---

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

See also

[LvStream::CloseBuffer\(\)](#).

5.19.2.3 LvHBuffer LvBuffer::GetHandle ()

Returns a handle of the Buffer (used in the Plain C API), associated with this class.

Returns

The Plain C API handle.

5.19.2.4 LvStatus LvBuffer::GetImgInfo (LvplmngInfo & *imgInfo*, uint32_t *Options* = 0)

Fills the [LvplmngInfo](#) structure for the image in the buffer. This simplifies a direct use of the [SynView Image Processing Library](#). If the image is processed, the image info points to the processed image, otherwise it points to the original image.

Parameters

<i>imgInfo</i>	The imgInfo structure, to which are the image parameters stored.
<i>Options</i>	Currently unused, must be 0.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.19.2.5 LvStatus LvBuffer::GetLastPaintRect (int32_t * *pX*, int32_t * *pY*, int32_t * *pWidth*, int32_t * *pHeight*)

Returns the rectangle to which the buffer was last painted. This is useful namely in case you have a tile mode and want to identify the buffer according a mouse click location. If the buffer was not yet painted by the renderer, the returned values are 0.

Parameters

<i>pX</i>	Pointer to X offset in pixels.
<i>pY</i>	Pointer to Y offset in pixels.
<i>pWidth</i>	Pointer to Width in pixels.
<i>pHeight</i>	Pointer to Height in pixels.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.19.2.6 void* LvBuffer::GetUserPtr ()

Returns a pointer to the Buffer (used in the Plain C API), associated with this class.

Returns

void pointer.

5.19.2.7 static LvStatus LvBuffer::Open (LvStream * *pStream*, void * *pDataPointer*, size_t *DataSize*, void * *pUserPointer*, uint32_t *Options*, LvBuffer *& *pBuffer*) [static]

Creates the [LvBuffer](#) class instance. On the GenTL level it corresponds to [DSAnnounceBuffer\(\)](#) or [DSAllocAndAnnounceBuffer\(\)](#).

Parameters

<i>pStream</i>	A pointer to the LvStream instance, obtained from the LvStream::Open() function.
<i>pDataPointer</i>	Pointer to image data buffer. This can be supplied by the application (in such case the <code>DataSize</code> must be set to the actual size of the buffer), or can be left NULL - in such case the buffer is allocated by SynView.
<i>DataSize</i>	Size of the buffer supplied, or 0 if the <i>pDataPointer</i> is NULL.
<i>pUserPointer</i>	A user pointer, which is then passed back in the LvEventCallbackNewBufferFunct() . It enables the application to reference some own data structure associated with the buffer.
<i>Options</i>	Currently unused, must be 0.
<i>pBuffer</i>	To this parameter the pointer to the LvBuffer instance is returned.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

See also

[LvStream::OpenBuffer\(\)](#).

5.19.2.8 [LvStatus](#) [LvBuffer::ParseChunkData](#) (`bool UpdateLayout = false`)

Parses the chunk data of the image. The chunk data are then accessible as device remote features (for example [LvDevice_ChunkTimestamp](#)).

Parameters

<i>UpdateLayout</i>	If set to true, the layout of chunk data is decoded. If set to false, the data are only read from already decoded layout - this is faster. Usually, the layout of the chunk data is constant, so it needs to be decoded only at first call of this function.
---------------------	--

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.19.2.9 [LvStatus](#) [LvBuffer::Queue](#) ()

Puts the buffer to the input buffer pool. This is an important part of the image handling loop: after the buffer with the acquired image is passed to the application, the application must return it to the input buffer pool by this function after processing.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.19.2.10 [LvStatus](#) [LvBuffer::SaveImageToBmpFile](#) (`const char * pFileName`)

Saves the image to a file in Windows BMP format. If the image is in the pixel format not compatible with the BMP format, it is automatically converted.

Parameters

<i>pFileName</i>	The file name. Be sure to specify it with the full path.
------------------	--

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.19.2.11 `LvStatus LvBuffer::SaveImageToJpgFile (const char * pFileName, uint32_t Quality)`

Saves the image to a file in JPEG format. If the image is in the pixel format not compatible with the JPEG format, it is automatically converted.

Parameters

<i>pFileName</i>	The file name. Be sure to specify it with the full path.
<i>Quality</i>	The quality factor in range from from 1 to 100. The higher is the factor, the higher is the quality and lower the compression.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.19.2.12 `LvStatus LvBuffer::SaveImageToTifFile (const char * pFileName, uint32_t Options = 0)`

Saves the image to a file in the TIFF format. If the image is in the pixel format not compatible with the TIF format, it is automatically converted.

Parameters

<i>pFileName</i>	The file name. Be sure to specify it with the full path.
<i>Options</i>	Options for saved pixel format. The LvipOption_TiffConvertTo16Bit flag can be used there.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.19.2.13 `LvStatus LvBuffer::UniCalculateWhiteBalance ()`

Calculates white balance factors from the current image.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.20 LvEvent methods

Functions

- static `LvStatus LvEvent::Open (LvSystem *pSystem, LvEventType EventType, LvEvent *&pEvent)`
- static `LvStatus LvEvent::Open (LvDevice *pDevice, LvEventType EventType, LvEvent *&pEvent)`
- static `LvStatus LvEvent::Open (LvStream *pStream, LvEventType EventType, LvEvent *&pEvent)`
- static `LvStatus LvEvent::Close (LvEvent *&pEvent)`
- `LvStatus LvEvent::Kill ()`
- `LvStatus LvEvent::Flush ()`
- `LvStatus LvEvent::WaitAndGetData (void *pBuffer, size_t *pSize, uint32_t Timeout=0xFFFFFFFF)`
- `LvStatus LvEvent::WaitAndGetNewBuffer (LvBuffer *&pBuffer, uint32_t Timeout=0xFFFFFFFF)`
- `LvStatus LvEvent::GetDataInfo (void *pInBuffer, size_t InSize, LvEventDataInfo Info, void *pBuffer, size_t *pSize, LvInfoDataType *pType=NULL, int32_t Param=0)`
- `LvStatus LvEvent::PutData (void *pBuffer, size_t Size)`
- `LvStatus LvEvent::SetCallback (LvEventCallbackFunc pFunction, void *pUserParam)`
- `LvStatus LvEvent::SetCallbackNewBuffer (LvEventCallbackNewBufferFunc pFunction, void *pUserParam)`
- `LvStatus LvEvent::StartThread ()`
- `LvStatus LvEvent::StopThread ()`
- `bool LvEvent::CallbackMustExit ()`
- `LvHEvent LvEvent::GetHandle ()`

5.20.1 Detailed Description

5.20.2 Function Documentation

5.20.2.1 bool LvEvent::CallbackMustExit ()

Indicates that the callback function for `LvEventSetCallback` or `LvEventSetCallbackNewBuffer` needs to exit as soon as possible This can be used in user callback functions to speed up closing

Returns

Returns the must exit status of the callback function of `LvEventType_NewBuffer`

5.20.2.2 static LvStatus LvEvent::Close (LvEvent *& pEvent) [static]

Deletes the `LvEvent` class instance.

Parameters

<i>pEvent</i>	A pointer to the <code>LvEvent</code> instance, obtained from the <code>LvEvent::Open()</code> function. This pointer is assigned NULL after the operation.
---------------	---

Returns

Returns the `LvStatus` value indicating the success of the requested operation. See [LvStatus definitions](#).

See also

[LvSystem::CloseEvent\(\)](#), [LvDevice::CloseEvent\(\)](#), [LvStream::CloseEvent\(\)](#).

5.20.2.3 `LvStatus LvEvent::Flush ()`

Discards all buffers in the output buffer queue (waiting to be delivered to the application).

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.20.2.4 `LvStatus LvEvent::GetDataInfo (void * pInBuffer, size_t InSize, LvEventDataInfo Info, void * pBuffer, size_t * pSize, LvInfoDataType * pType = NULL, int32_t Param = 0)`

Enables to parse the buffer from [LvEvent::WaitAndGetData](#).

Parameters

<i>pInBuffer</i>	Pointer to a buffer containing event data. This value must not be NULL.
<i>InSize</i>	Size of the provided pInBuffer in bytes.
<i>Info</i>	One of the LvEventDataInfo .
<i>pBuffer</i>	Pointer to a user allocated buffer to receive the requested information. If this parameter is NULL, pSize will contain the minimal size of pBuffer in bytes. If the pType is a string, the size includes the terminating 0.
<i>pSize</i>	Size of the buffer is returned in this parameter.
<i>pType</i>	One of the LvInfoDataType .
<i>Param</i>	Additional parameter, if used, its role is explained by the LvEventDataInfo .

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.20.2.5 `LvHEvent LvEvent::GetHandle ()`

Returns a handle of the Event (used in the Plain C API), associated with this class.

Returns

The Plain C API handle.

5.20.2.6 `LvStatus LvEvent::Kill ()`

Terminates a single wait in the [LvEvent::WaitAndGetData\(\)](#) function.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.20.2.7 `static LvStatus LvEvent::Open (LvSystem * pSystem, LvEventType EventType, LvEvent *& pEvent)`
[static]

Creates the [LvEvent](#) class instance for specified [LvSystem](#) module.

Parameters

<i>pSystem</i>	Owner LvSystem instance.
<i>EventType</i>	One of the LvEventType .
<i>pEvent</i>	In this parameter a pointer to LvEvent instance is returned.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

See also

[LvSystem::OpenEvent\(\)](#).

5.20.2.8 `static LvStatus LvEvent::Open (LvDevice * pDevice, LvEventType EventType, LvEvent *& pEvent)`
`[static]`

Creates the [LvEvent](#) class instance for specified [LvDevice](#) module.

Parameters

<i>pDevice</i>	Owner LvDevice instance.
<i>EventType</i>	One of the LvEventType .
<i>pEvent</i>	In this parameter a pointer to LvEvent instance is returned.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

See also

[LvDevice::OpenEvent\(\)](#).

5.20.2.9 `static LvStatus LvEvent::Open (LvStream * pStream, LvEventType EventType, LvEvent *& pEvent)`
`[static]`

Creates the [LvEvent](#) class instance for specified [LvStream](#) module.

Parameters

<i>pStream</i>	Owner LvStream instance.
<i>EventType</i>	One of the LvEventType .
<i>pEvent</i>	In this parameter a pointer to LvEvent instance is returned.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

See also

[LvStream::OpenEvent\(\)](#).

5.20.2.10 `LvStatus LvEvent::PutData (void * pBuffer, size_t Size)`

Puts a new event to Event output queue. This function can be used only for user-defined events.

Parameters

<i>pBuffer</i>	Pointer to event data.
<i>Size</i>	Size of the event data.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.20.2.11 **LvStatus** LvEvent::SetCallback (LvEventCallbackFunct *pFunction*, void * *pUserParam*)

Specifies a callback function for the event thread. Note that the callback function cannot be a method of a class.

Parameters

<i>pFunction</i>	The callback function in the forms of LvEventCallbackFunct .
<i>pUserParam</i>	User parameter, which will be passed to each callback call.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.20.2.12 **LvStatus** LvEvent::SetCallbackNewBuffer (LvEventCallbackNewBufferFunct *pFunction*, void * *pUserParam*)

Specifies a callback function for the thread of the Event of the [LvEventType_NewBuffer](#). Once the application specifies this callback, it becomes responsible for returning the image buffers to the input buffer pool. Note that the callback function cannot be a method of a class.

Parameters

<i>pFunction</i>	The callback function in the forms of LvEventCallbackNewBufferFunct .
<i>pUserParam</i>	User parameter, which will be passed to each callback call.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.20.2.13 **LvStatus** LvEvent::StartThread ()

Starts an internal thread, which waits for events and passes them to specified callback function. When the thread is started, the application must no longer call the [LvEvent::WaitAndGetData\(\)](#) or [LvEvent::WaitAndGetNewBufer\(\)](#) functions - this is called internally in the thread and upon return from this function a callback function is called.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.20.2.14 **LvStatus** LvEvent::StopThread ()

Stops the event internal thread.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.20.2.15 LvStatus LvEvent::WaitAndGetData (void * *pBuffer*, size_t * *pSize*, uint32_t *Timeout* = 0xFFFFFFFF)

Waits for the event and gets its data in one atomic operation. Use this function only for events other than LvEvent↔Type_NewBuffer, for the the LvEventType_NewBuffer event type use the [LvEvent::WaitAndGetNewBuffer\(\)](#) function instead. Do not use this function if you use the callback - see [LvEvent::SetCallback\(\)](#) or [LvEvent::SetCallback↔NewBuffer\(\)](#).

Parameters

<i>pBuffer</i>	Pointer to a user allocated buffer to receive the event data. The buffer can be parsed by the LvEvent::GetDataInfo() function.
<i>pSize</i>	Size of the buffer must be specified in this parameter and after the function returns, the actual size is returned in this parameter.
<i>Timeout</i>	The wait timeout in milliseconds. The value 0xFFFFFFFF is considered as infinite. Note that you can also kill waiting from another thread using the LvEvent::Kill() function.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.20.2.16 LvStatus LvEvent::WaitAndGetNewBuffer (LvBuffer *& *pBuffer*, uint32_t *Timeout* = 0xFFFFFFFF)

Waits for the event and gets its data in one atomic operation. Use this function only for events of the LvEventType↔_NewBuffer type. Do not use this function if you use the callback - see [LvEvent::SetCallback\(\)](#) or [LvEvent::Set↔CallbackNewBuffer\(\)](#).

Parameters

<i>pBuffer</i>	The pointer to the received LvBuffer instance is returned in this parameter.
<i>Timeout</i>	The wait timeout in milliseconds. The value 0xFFFFFFFF is considered as infinite. Note that you can also kill waiting from another thread using the LvEvent::Kill() function.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.21 LvRenderer methods

Functions

- static [LvStatus LvRenderer::Open](#) ([LvStream](#) *pStream, [LvRenderer](#) *&pRenderer)
- static [LvStatus LvRenderer::Start](#) ([LvRenderer](#) *&pRenderer)
- static [LvStatus LvRenderer::Stop](#) ([LvRenderer](#) *&pRenderer)
- static [LvStatus LvRenderer::Close](#) ([LvRenderer](#) *&pRenderer)
- [LvStatus LvRenderer::SetWindow](#) (void *pDisplay, int64_t hWindow)
- [LvStatus LvRenderer::DisplayImage](#) ([LvBuffer](#) *pBuffer, uint32_t RenderFlags=0)
- [LvStatus LvRenderer::Repaint](#) (uint32_t RenderFlags=0)
- [LvHRenderer LvRenderer::GetHandle](#) ()

5.21.1 Detailed Description

5.21.2 Function Documentation

5.21.2.1 static [LvStatus LvRenderer::Close](#) ([LvRenderer](#) *& *pRenderer*) [static]

Deletes the [LvRenderer](#) class instance.

Parameters

<i>pRenderer</i>	A pointer to the LvRenderer instance, obtained from the LvRenderer::Open() function. This pointer is set to NULL after close.
------------------	---

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

See also

[LvStream::CloseRenderer\(\)](#).

5.21.2.2 [LvStatus LvRenderer::DisplayImage](#) ([LvBuffer](#) * *pBuffer*, uint32_t *RenderFlags* = 0)

Displays the image. The image display mode is set by [Renderer](#) features, see [LvRendererFtr](#).

Parameters

<i>pBuffer</i>	Pointer to the LvBuffer to be displayed.
<i>RenderFlags</i>	Zero or a combination of LvRenderFlags .

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.21.2.3 [LvHRenderer LvRenderer::GetHandle](#) ()

Returns a handle of the [Renderer](#) (used in the Plain C API), associated with this class.

Returns

The Plain C API handle.

5.21.2.4 static LvStatus LvRenderer::Open (LvStream * pStream, LvRenderer *& pRenderer) [static]

Creates the [LvRenderer](#) class instance for image display. The renderer attempts to load the sv.synview.display library. In case of SynView installation in an operating system without possibility to graphically display (for example Linux without XWindows), the load of this library fails and the calls to Renderer functions will return errors.

Parameters

<i>pStream</i>	A pointer to the LvStream instance, obtained from the LvStream::Open() function.
<i>pRenderer</i>	In this parameter the pointer to the LvRenderer is returned.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

See also

[LvStream::OpenRenderer\(\)](#).

5.21.2.5 LvStatus LvRenderer::Repaint (uint32_t RenderFlags = 0)

Repaints the contents of the display window. In order to be able to repaint, all images to be displayed must be still held by the application, i.e. must not be returned to the input buffer pool. See also [LvStream_LvPostponeQueue↔Buffers](#) feature. A typical usage of this function is in the WM_PAINT handler in a Windows application.

Parameters

<i>RenderFlags</i>	Zero or a combination of LvRenderFlags .
--------------------	--

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.21.2.6 LvStatus LvRenderer::SetWindow (void * pDisplay, int64_t hWindow)

Sets the target window, in which the renderer has to display. Note that the application itself assure any repainting (when the window need to be repainted due to a movement of overlapping) - use [LvRenderer::Repaint\(\)](#) in such case.

Parameters

<i>pDisplay</i>	Pointer to the display. It is defined as void* in order to make SynView header files independent on XWindows.
<i>hWindow</i>	Handle to the window.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.21.2.7 static LvStatus LvRenderer::Start (LvRenderer *& pRenderer) [static]

Starts the [LvRenderer](#) class instance.

Parameters

<i>pRenderer</i>	A pointer to the LvRenderer instance, obtained from the LvRenderer::Open() function. This pointer is set to NULL after close.
------------------	---

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

See also

[LvStream::StartRenderer\(\)](#).

5.21.2.8 static LvStatus LvRenderer::Stop (LvRenderer *& pRenderer) [static]

Stops the [LvRenderer](#) class instance.

Parameters

<i>pRenderer</i>	A pointer to the LvRenderer instance, obtained from the LvRenderer::Open() function. This pointer is set to NULL after close.
------------------	---

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

See also

[LvStream::StopRenderer\(\)](#).

5.22 LvModule methods

Functions

- [LvStatus LvModule::GetNumFeatures](#) ([LvFtrGroup](#) FtrGroup, [uint32_t](#) *pNumFeatures)
- [LvStatus LvModule::GetFeatureAt](#) ([LvFtrGroup](#) FtrGroup, [uint32_t](#) Index, [LvFeature](#) *pFeature, [uint32_t](#) *pLevel=NULL)
- [LvStatus LvModule::GetFeatureByName](#) ([LvFtrGroup](#) FtrGroup, [const char](#) *pName, [LvFeature](#) *pFeature)
- [bool LvModule::IsImplemented](#) ([LvFeature](#) Feature)
- [bool LvModule::IsImplementedByName](#) ([LvEnum](#) FeatureGroup, [const char](#) *pName)
- [bool LvModule::IsAvailable](#) ([LvFeature](#) Feature)
- [bool LvModule::IsAvailableByName](#) ([LvEnum](#) FeatureGroup, [const char](#) *pName)
- [bool LvModule::IsReadable](#) ([LvFeature](#) Feature)
- [bool LvModule::IsWritable](#) ([LvFeature](#) Feature)
- [bool LvModule::IsAvailableEnumEntry](#) ([LvFeature](#) Feature, [LvEnum](#) EnumEntry)
- [bool LvModule::IsImplementedEnumEntry](#) ([LvFeature](#) Feature, [LvEnum](#) EnumEntry)
- [LvStatus LvModule::GetType](#) ([LvFeature](#) Feature, [LvFtrType](#) *pFtrType, [LvFtrGui](#) *pFtrGui=NULL, [LvFtrGroup](#) *pFtrGroup=NULL)

5.22.1 Detailed Description

5.22.2 Function Documentation

5.22.2.1 `LvStatus LvModule::CmdExecute (LvFeature Feature, uint32_t Timeout = 0)`

Executes a command.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the <code>LvModule::GetFeatureByName()</code> function.
<i>Timeout</i>	If greater than 0, the <code>LvModule::CmdIsDone()</code> is called in a loop to wait for the command completion, until the <code>LvModule::CmdIsDone()</code> returns true or the Timeout (in milliseconds) expires. If set to 0, no wait is done.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.22.2.2 `LvStatus LvModule::CmdIsDone (LvFeature Feature, bool * plsDone)`

Checks if the command execution has completed.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the <code>LvModule::GetFeatureByName()</code> function.
<i>plsDone</i>	In this parameter is returned true, if the command is completed, otherwise false.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.22.2.3 LvStatus LvModule::GetAccess (LvFeature *Feature*, LvFtrAccess * *pFtrAccess*)

Gets the access mode of the feature.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>pFtrAccess</i>	The access is returned in this parameter. One of the LvFtrAccess .

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.22.2.4 **LvStatus** LvModule::GetBool (LvFeature *Feature*, bool * *pValue*)

Gets a Boolean value.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>pValue</i>	The bool value is returned in this parameter.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.22.2.5 **LvStatus** LvModule::GetBuffer (LvFeature *Feature*, void * *pBuffer*, size_t *Size*)

Gets a block of data.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>pBuffer</i>	Pointer to a buffer, to which the data will be stored.
<i>Size</i>	Size of the buffer.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.22.2.6 **LvStatus** LvModule::GetBufferSize (LvFeature *Feature*, size_t * *pSize*)

Gets the block data size.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>pSize</i>	The needed size of the buffer is returned in this parameter.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.22.2.7 **LvStatus** LvModule::GetEnum (LvFeature *Feature*, LvEnum * *pValue*)

Gets the SynView constant for the enumeration entry, if exists. If does not exist, you must work with the string enumeration entry value.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>pValue</i>	SynView constant for the enum entry is returned in this parameter.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.22.2.8 LvStatus LvModule::GetEnumStr (LvFeature *Feature*, char * *pSymbolicName*, size_t *Size*)

Gets the enumeration entry as a string (symbolic name). It is not possible to get the needed size for this single feature, instead, it is possible to get the maximum size of the all enum values of this feature, by the [LvModule::GetInfo\(LvFtrInfo_EnumEntryNameMaxSize\)](#) function.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>pSymbolicName</i>	A pointer to a string buffer, where the symbolic name will be returned.
<i>Size</i>	Size of the buffer.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.22.2.9 LvStatus LvModule::GetEnumStr (LvFeature *Feature*, std::string & *sSymbolicName*)

Gets the enumeration entry as a standard string (symbolic name).

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>sSymbolicName</i>	A string, where the symbolic name will be returned.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.22.2.10 LvStatus LvModule::GetEnumStrByVal (LvFeature *Feature*, LvEnum *Value*, char * *pSymbolicName*, size_t *SymbolicNameSize*, LvFtrAccess * *pFtrAccess* = NULL)

Returns a string symbolic name of the enum entry for the SynView constant.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>Value</i>	The SynView constant for the enum entry.
<i>pSymbolicName</i>	Pointer to string buffer, where the symbolic name is returned. Can be NULL.

<i>SymbolicNameSize</i>	Size of pSymbolicName buffer.
<i>pFtrAccess</i>	The access mode of the enum entry is returned in this parameter - one of LvFtrAccess . Can be NULL.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.22.2.11 `LvStatus LvModule::GetEnumStrByVal (LvFeature Feature, LvEnum Value, std::string & sSymbolicName, LvFtrAccess * pFtrAccess = NULL)`

Returns a string symbolic name of the enum entry for the SynView constant.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>Value</i>	The SynView constant for the enum entry.
<i>sSymbolicName</i>	In this parameter the symbolic name is returned.
<i>pFtrAccess</i>	The access mode of the enum entry is returned in this parameter - one of LvFtrAccess . Can be NULL.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.22.2.12 `LvStatus LvModule::GetEnumValByStr (LvFeature Feature, const char * pSymbolicName, LvEnum * pValue, LvFtrAccess * pFtrAccess = NULL)`

Gets the SynView constant for the enumeration entry, if exists.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>pSymbolicName</i>	A string with symbolic name of the enum entry.
<i>pValue</i>	The SynView constant for the enum entry is returned in this parameter. If the SynView constant does not exist for this enumeration entry, 0 is returned (no error is indicated).
<i>pFtrAccess</i>	The feature access is returned in this parameter - one of LvFtrAccess . Can be NULL.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.22.2.13 `LvStatus LvModule::GetFeatureAt (LvFtrGroup FtrGroup, uint32_t Index, LvFeature * pFeature, uint32_t * pLevel = NULL)`

Returns the feature ID at specified position. Can be used to iterate all the features in a list.

Parameters

<i>FtrGroup</i>	One of the LvFtrGroup .
<i>Index</i>	Zero based index of the feature in the list.
<i>pFeature</i>	Feature ID is returned in this parameter.
<i>pLevel</i>	Feature Level expressing its position in the tree is returned in this parameter. The base level has value 1.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.22.2.14 LvStatus LvModule::GetFeatureByName (LvFtrGroup *FtrGroup*, const char * *pName*, LvFeature * *pFeature*)

Returns a feature ID based on the feature name. This function is a substantial function for the generic approach to the feature - by this function you can get the ID of any existing feature, that means also for those, for which a SynView constant is not defined. Be sure to check the success of this function - if the feature is not mandatory, it may not exist.

Parameters

<i>FtrGroup</i>	One of the LvFtrGroup .
<i>pName</i>	Name of the feature.
<i>pFeature</i>	Feature ID is returned in this parameter.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.22.2.15 LvStatus LvModule::GetFloat (LvFeature *Feature*, double * *pValue*)

Gets a float value.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>pValue</i>	The float value is returned in this parameter.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.22.2.16 LvStatus LvModule::GetFloatRange (LvFeature *Feature*, double * *pMinValue*, double * *pMaxValue*, double * *pIncrement* = NULL)

Returns a range of a float feature.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>pMinValue</i>	The minimum value is returned in this parameter. Can be NULL.

<i>pMaxValue</i>	The maximum value is returned in this parameter. Can be NULL.
<i>pIncrement</i>	The increment value is returned in this parameter. If the increment is not defined, 0 is returned. Can be NULL.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.22.2.17 LvStatus LvModule::GetInfo (LvFeature *Feature*, LvFtrInfo *FtrInfo*, int32_t * *pInfo*, int32_t *Param* = 0)

Gets an info in form of a 32-bit integer value.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>FtrInfo</i>	One of the LvFtrInfo .
<i>pInfo</i>	The value is returned in this parameter.
<i>Param</i>	Additional parameter, required by some types of info.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.22.2.18 LvStatus LvModule::GetInfoStr (LvFeature *Feature*, LvFtrInfo *FtrInfo*, char * *pInfoStr*, size_t *Size*, int32_t *Param* = 0)

Gets an info in form of a string value.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>FtrInfo</i>	One of the LvFtrInfo .
<i>pInfoStr</i>	The string value is returned in this parameter.
<i>Size</i>	Size of the buffer (to which pInfoStr points).
<i>Param</i>	Additional parameter, required by some types of info.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.22.2.19 LvStatus LvModule::GetInfoStr (LvFeature *Feature*, LvFtrInfo *FtrInfo*, std::string & *sInfoStr*, int32_t *Param* = 0)

Gets an info in form of a string value.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
----------------	---

<i>FtrInfo</i>	One of the LvFtrInfo .
<i>sInfoStr</i>	The string value is returned in this parameter.
<i>Param</i>	Additional parameter, required by some types of info.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.22.2.20 [LvStatus](#) [LvModule::GetInfoStrSize](#) ([LvFeature](#) *Feature*, [LvFtrInfo](#) *FtrInfo*, [size_t](#) * *pSize*, [int32_t](#) *Param* = 0)

Gets a buffer size needed for an info in form of a string value.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>FtrInfo</i>	One of the LvFtrInfo .
<i>pSize</i>	Size of the buffer is returned in this parameter.
<i>Param</i>	Additional parameter, required by some types of info.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.22.2.21 [LvStatus](#) [LvModule::GetInt](#) ([LvFeature](#) *Feature*, [int64_t](#) * *pValue*)

Gets a 64-bit integer value.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>pValue</i>	The integer value is returned in this parameter.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

Note

This function is equal to the [LvModule::GetInt64\(\)](#) function.

5.22.2.22 [LvStatus](#) [LvModule::GetInt32](#) ([LvFeature](#) *Feature*, [int32_t](#) * *pValue*)

Gets a 32-bit integer value.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
----------------	---

<i>pValue</i>	The integer value is returned in this parameter.
---------------	--

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

Note

The value is internally kept always as a 64-bit value; the functions for setting and getting a 32-bit value are provided just for convenience.

5.22.2.23 **LvStatus** LvModule::GetInt32Range (LvFeature *Feature*, int32_t * *pMinValue*, int32_t * *pMaxValue*, int32_t * *pIncrement*)

Returns a range and increment of an 32-bit integer feature.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>pMinValue</i>	The minimum value is returned in this parameter. Can be NULL.
<i>pMaxValue</i>	The maximum value is returned in this parameter. Can be NULL.
<i>pIncrement</i>	The increment value is returned in this parameter. Can be NULL.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

Note

The value is internally kept always as a 64-bit value; the functions for setting and getting a 32-bit value are provided just for convenience.

5.22.2.24 **LvStatus** LvModule::GetInt64 (LvFeature *Feature*, int64_t * *pValue*)

Gets a 64-bit integer value.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>pValue</i>	The integer value is returned in this parameter.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

Note

This function is equal to the [LvModule::GetInt\(\)](#) function.

5.22.2.25 **LvStatus** LvModule::GetInt64Range (LvFeature *Feature*, int64_t * *pMinValue*, int64_t * *pMaxValue*, int64_t * *pIncrement*)

Returns a range and increment of an 64-bit integer feature.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>pMinValue</i>	The minimum value is returned in this parameter. Can be NULL.
<i>pMaxValue</i>	The maximum value is returned in this parameter. Can be NULL.
<i>pIncrement</i>	The increment value is returned in this parameter. Can be NULL.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

Note

This function is equal to the [LvModule::GetIntRange\(\)](#) function.

5.22.2.26 `LvStatus LvModule::GetIntRange (LvFeature Feature, int64_t * pMinValue, int64_t * pMaxValue, int64_t * pIncrement)`

Returns a range and increment of an 64-bit integer feature.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>pMinValue</i>	The minimum value is returned in this parameter. Can be NULL.
<i>pMaxValue</i>	The maximum value is returned in this parameter. Can be NULL.
<i>pIncrement</i>	The increment value is returned in this parameter. Can be NULL.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

Note

This function is equal to the [LvModule::GetInt64Range\(\)](#) function.

5.22.2.27 `LvStatus LvModule::GetNumFeatures (LvFtrGroup FtrGroup, uint32_t * pNumFeatures)`

Returns a number of features for specified group. This is useful for building a list of all available features (like the tree in lv.explorer).

Parameters

<i>FtrGroup</i>	One of the LvFtrGroup .
<i>pNumFeatures</i>	The number of features is returned in this parameter.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.22.2.28 `LvStatus LvModule::GetPtr (LvFeature Feature, void ** ppValue)`

Gets a pointer.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>ppValue</i>	The pointer is returned in this parameter.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.22.2.29 `LvStatus LvModule::GetString (LvFeature Feature, char * pValue, size_t Size)`

Gets a string value. If you need first to get the string size, use the [LvModule::GetStringSize\(\)](#) function.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>pValue</i>	Pointer to a null-terminated string buffer.
<i>Size</i>	Size of the buffer.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.22.2.30 `LvStatus LvModule::GetString (LvFeature Feature, std::string & sValue)`

Gets a string value as `std::string`.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>sValue</i>	In this parametr the string value is returned.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.22.2.31 `LvStatus LvModule::GetStringSize (LvFeature Feature, size_t * pSize)`

Gets a buffer size needed for a string.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>pSize</i>	Size of the buffer (including space for terminating zero) is returned in this parameter.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.22.2.32 `LvStatus LvModule::GetType (LvFeature Feature, LvFtrType * pFtrType, LvFtrGui * pFtrGui = NULL, LvFtrGroup * pFtrGroup = NULL)`

Returns the feature type, GUI representation and group.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>pFtrType</i>	The feature type is returned in this parameter. The returned value is one of the LvFtrType . Can be NULL.
<i>pFtrGui</i>	The feature GUI representation is returned in this parameter. The returned value is one of the LvFtrGui . Can be NULL.
<i>pFtrGroup</i>	The feature group, to which the feature belongs. The returned value is one of the LvFtrGroup . Can be NULL.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.22.2.33 **LvStatus LvModule::GetVisibility (LvFeature Feature, LvFtrVisibility * pFtrVisibility)**

Gets the feature visibility (beginner-expert-guru).

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>pFtrVisibility</i>	The visibility is returned in this parameter. One of the LvFtrVisibility .

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.22.2.34 **bool LvModule::IsAvailable (LvFeature Feature)**

A helper function, allowing simply to determine, if a feature is available. It is a wrapper around the [LvModule::GetAccess\(\)](#) function.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
----------------	---

Returns

If the feature is available, returns true, otherwise false.

5.22.2.35 **bool LvModule::IsAvailableByName (LvEnum FeatureGroup, const char * pName)**

A helper function, allowing simply to determine, if a feature is available. It is a wrapper around the [LvModule::GetAccess\(\)](#) and [LvModule::GetFeatureByName\(\)](#) functions.

Parameters

<i>FeatureGroup</i>	One of the LvFtrGroup .
<i>pName</i>	Name of the feature.

Returns

If the feature is available, returns true, otherwise false.

5.22.2.36 `bool LvModule::IsAvailableEnumEntry (LvFeature Feature, LvEnum EnumEntry)`

A helper function, allowing simply to determine, if an enum entry of an enum feature is available.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>EnumEntry</i>	The SynView constant for the enum entry.

Returns

If the enum entry is available, returns true, otherwise false.

5.22.2.37 `bool LvModule::IsImplemented (LvFeature Feature)`

A helper function, allowing simply to determine, if a feature is implemented. It is a wrapper around the [LvModule::GetAccess\(\)](#) function.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
----------------	---

Returns

If the feature is implemented, returns true, otherwise false.

5.22.2.38 `bool LvModule::IsImplementedByName (LvEnum FeatureGroup, const char * pName)`

A helper function, allowing simply to determine, if a feature is implemented. It is a wrapper around the [LvModule::GetAccess\(\)](#) and [LvModule::GetFeatureByName\(\)](#) functions.

Parameters

<i>FeatureGroup</i>	One of the LvFtrGroup .
<i>pName</i>	Name of the feature.

Returns

If the feature is implemented, returns true, otherwise false.

5.22.2.39 `bool LvModule::IsImplementedEnumEntry (LvFeature Feature, LvEnum EnumEntry)`

A helper function, allowing simply to determine, if an enum entry of an enum feature is implemented.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>EnumEntry</i>	The SynView constant for the enum entry.

Returns

If the enum entry is implemented, returns true, otherwise false.

5.22.2.40 `bool LvModule::IsReadable (LvFeature Feature)`

A helper function, allowing simply to determine, if a feature is readable. It is a wrapper around the [LvModule::GetAccess\(\)](#) function.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
----------------	---

Returns

If the feature is readable, returns true, otherwise false.

5.22.2.41 `bool LvModule::IsWritable (LvFeature Feature)`

A helper function, allowing simply to determine, if a feature is writable. It is a wrapper around the [LvModule::GetAccess\(\)](#) function.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
----------------	---

Returns

If the feature is writable, returns true, otherwise false.

5.22.2.42 `LvStatus LvModule::Poll ()`

Polls all the non-cached features of the module. If the feature polling interval expires, the value is read and the feature callback is called.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.22.2.43 `LvStatus LvModule::RegisterFeatureCallback (LvFeature Feature, LvFeatureCallbackFunct pFunction, void * pUserParam = NULL, void * pFeatureParam = NULL)`

Registers or unregisters a callback function for the feature. This callback is produced by GenApi when a feature changes its value or status. The application should process this callback fast. Note that the callback can be called also from another thread - see [LvEventType_FeatureDevEvent](#). Important note: The feature callback function should never set any other feature. Doing so can lead to recursions, which would be probably hard to diagnose and could cause unexpected behavior.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>pFunction</i>	The callback function in the form of LvFeatureCallbackFunct . If you want to unregister the function, use NULL at this parameter.
<i>pUserParam</i>	User parameter, which will be passed to each callback call.
<i>pFeatureParam</i>	Second user parameter, which will be passed to each callback call.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.22.2.44 `LvStatus LvModule::SetBool (LvFeature Feature, bool Value)`

Sets a Boolean value.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>Value</i>	Value to be set.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.22.2.45 `LvStatus LvModule::SetBuffer (LvFeature Feature, void * pBuffer, size_t Size)`

Sets a block of data.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>pBuffer</i>	Pointer to the data.
<i>Size</i>	Size of the data.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.22.2.46 `LvStatus LvModule::SetEnum (LvFeature Feature, LvEnum Value)`

Sets the enumeration entry by the SynView constant. If the SynView constant is not defined for the feature, then use [LvModule::SetEnumStr\(\)](#) to set the enum entry by a string.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>Value</i>	SynView constant for the requested enumeration entry.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.22.2.47 `LvStatus LvModule::SetEnumStr (LvFeature Feature, const char * pSymbolicName)`

Sets enumeration entry by its string symbolic name.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>pSymbolicName</i>	A string with the symbolic name of the enumeration entry.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.22.2.48 `LvStatus LvModule::SetFloat (LvFeature Feature, double Value)`

Sets a float value.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>Value</i>	The value to be set.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.22.2.49 [LvStatus](#) [LvModule::SetInt](#) ([LvFeature](#) *Feature*, [int64_t](#) *Value*)

Sets a 64-bit integer value.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>Value</i>	Value to be set.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

Note

This function is equal to the [LvModule::SetInt64\(\)](#) function.

5.22.2.50 [LvStatus](#) [LvModule::SetInt32](#) ([LvFeature](#) *Feature*, [int32_t](#) *Value*)

Sets a 32-bit value.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>Value</i>	Value to be set.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

Note

The value is internally kept always as a 64-bit value; the functions for setting and getting a 32-bit value are provided just for convenience.

5.22.2.51 [LvStatus](#) [LvModule::SetInt64](#) ([LvFeature](#) *Feature*, [int64_t](#) *Value*)

Sets a 64-bit integer value.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>Value</i>	Value to be set.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

Note

This function is equal to the [LvModule::SetInt\(\)](#) function.

5.22.2.52 `LvStatus LvModule::SetPtr (LvFeature Feature, void * pValue)`

Sets a pointer.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>pValue</i>	The pointer to be set.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.22.2.53 `LvStatus LvModule::SetString (LvFeature Feature, const char * pValue)`

Sets a string value.

Parameters

<i>Feature</i>	The feature ID - use a symbolic constant (one of the Features) or an ID obtained by the LvModule::GetFeatureByName() function.
<i>pValue</i>	The string value (null-terminated).

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.22.2.54 `LvStatus LvModule::StartPollingThread (uint32_t PollingTime = 1000, bool PollChildren = false)`

Starts a thread, which in a loop polls the non-cached features. If the feature polling interval expires, the value is read and the feature callback is called.

Parameters

<i>PollingTime</i>	A time in milliseconds between 2 calls to poll the features.
<i>PollChildren</i>	If set to true, also the features in all children modules are polled. For example, if your application uses only one System module, then it is a parent of all other modules, so the polling will be propagated to all modules from a single thread. If a module has started own polling thread, then it is excluded from the propagating.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.22.2.55 LvStatus LvModule::StopPollingThread ()

Stops the polling thread. See [LvModule::StartPollingThread\(\)](#) for details.

Returns

Returns the [LvStatus](#) value indicating the success of the requested operation. See [LvStatus definitions](#).

5.22.3 Variable Documentation

5.22.3.1 LvHModule LvModule::m_hModule [protected]

The base class handle.

Definition at line 1317 of file sv.synview.class.h.

5.24.1 Detailed Description

5.24.2 Macro Definition Documentation

5.24.2.1 `#define LV_DLENTY`

Typedef for the API functions calling convention and export/import type.

Definition at line 108 of file `sv.synview.defs.h`.

5.24.2.2 `#define LVIP_DLENTY`

Typedef for the API functions calling convention and export/import type.

Definition at line 118 of file `sv.synview.defs.h`.

5.24.3 Typedef Documentation

5.24.3.1 `typedef void(* LvEventCallbackFunct) (void *pBuffer, size_t Size, void *pUserParam)`

Prototype for the general callback function, which can be registered at the Event, using the [LvEventSetCallback\(\)](#) function or [LvEvent::SetCallback\(\)](#) class. IMPORTANT: the function must have the LV_STDC calling convention.

Parameters

<i>pBuffer</i>	Pointer to buffer, extracted from the output queue.
<i>Size</i>	Buffer size.

<i>pUserParam</i>	User parameter, supplied in the LvEventSetCallback() function or LvEvent::SetCallback() . It enables the application to distinguish from which object the callback was called in case the same callback function is shared by multiple Event modules.
-------------------	---

Definition at line 294 of file sv.synview.defs.h.

5.24.3.2 typedef void(* LvEventCallbackNewBufferFunc) (LvHBuffer hBuffer, void *pUserPointer, void *pUserParam)

Prototype for the new image callback function, which can be registered at the Event, using the [LvEventSetCallbackNewBuffer\(\)](#) function or [LvEvent::SetCallbackNewBuffer\(\)](#) class. IMPORTANT: the function must have the LV_S_TDC calling convention.

Parameters

<i>hBuffer</i>	Handle to LvBuffer , extracted from the output queue.
<i>pUserPointer</i>	The pUserPointer of the LvBuffer is passed here. In the C++ wrapper class this is used to give direct pointer to the LvBuffer class instance.
<i>pUserParam</i>	User parameter, supplied in the LvEventSetCallbackNewBuffer() function or LvEvent::SetCallbackNewBuffer() . It enables the application to distinguish from which object the callback was called in case the same callback function is shared by multiple Event modules.

Definition at line 311 of file sv.synview.defs.h.

5.24.3.3 typedef void(* LvFeatureCallbackFunc) (void *pUserParam, void *pFeatureParam, const char *pName)

Prototype for the feature updated callback function, which can be registered using the [LvRegisterFeatureCallback\(\)](#) function. IMPORTANT: the function must have the LV_STDC calling convention.

Parameters

<i>pUserParam</i>	User pUserParam, supplied in the LvRegisterFeatureCallback() function. It can be used to distinguish from which object the callback was called in case the same callback function is shared by multiple Event modules.
<i>pFeatureParam</i>	The pFeatureParam passed in the LvRegisterFeatureCallback() . It is usually used to identify the feature, which has changed.
<i>pName</i>	The string ID of the feature.

Definition at line 327 of file sv.synview.defs.h.

5.24.3.4 typedef uint32_t LvHModule

Base typedef for a handle to a module.

Definition at line 262 of file sv.synview.defs.h.

LvFindBy_DisplayName, LvFindBy_GevIPAddress, LvFindBy_GevMACAddress, LvFindBy_SerialNumber,
LvFindBy_Any }

5.25.1 Detailed Description

5.25.2 Enumeration Type Documentation

5.25.2.1 enum LvEventDataInfo

LvEventDataInfo constants. Define values for the info specification in the [LvEventGetDataInfo\(\)](#) function.

Enumerator

LvEventDataInfo_Id Represents the GenTL EVENT_DATA_ID - Event ID. See [LvEventType](#) for the explanation, what this ID means according to the event type.

LvEventDataInfo_Value Represents the GenTL EVENT_DATA_VALUE - Event Data. See [LvEventType](#) for the explanation, what this data means according to the event type.

Definition at line 3836 of file sv.synview.enums.h.

5.25.2.2 enum LvEventType

LvEventType constants. Currently only the [LvEventType_NewBuffer](#) is supported by SynView.

Enumerator

LvEventType_Error Represents the GenTL EVENT_ERROR - Notification on module errors. For this type of event the [LvEventDataInfo_Id](#) is [LvInfoDataType_Int32](#) and [LvEventDataInfo_Value](#) is [LvInfoDataType_String](#).

LvEventType_NewBuffer Represents the GenTL EVENT_NEW_BUFFER - Notification on newly filled buffers placed to the output queue. For this type of event the [LvEventDataInfo_Id](#) is [LvInfoDataType_Ptr](#) (GenTL Buffer handle) and [LvEventDataInfo_Value](#) is [LvInfoDataType_Ptr](#) (Private pointer).

LvEventType_FeatureInvalidate Represents the GenTL EVENT_FEATURE_INVALIDATE - Notification if a feature was changed by the GenTL Producer library and thus needs to be invalidated in the GenICam GenApi instance using the module.

LvEventType_FeatureChange Represents the GenTL EVENT_FEATURE_CHANGE - Notification if the GenTL Producer library wants to manually set a feature in the GenICam GenApi instance using the module.

LvEventType_FeatureDevEvent Represents the GenTL EVENT_FEATURE_DEVEVENT - Notification if the GenTL Producer wants to inform the GenICam GenApi instance of the remote device that a GenApi compatible event was fired. This event is processed internally in SynView API - it is converted into the feature change callback - see the [LvModule::RegisterFeatureCallback\(\)](#) function. However, the thread which checks the GenTL event and converts it into the callbacks must be started explicitly by the application - see the [LvEventStartThread\(\)](#) function. This event type can be opened only on the Device module.

LvEventType_Module Represents the GenTL EVENT_MODULE - Notification if the GenTL Producer wants to inform the GenICam GenApi instance of the module that a GenApi compatible event was fired.

Definition at line 3787 of file sv.synview.enums.h.

5.25.2.3 enum LvFindBy

Enum values for the [LvSystemFindInterface\(\)](#) and [LvInterfaceFindDevice\(\)](#) functions.

Enumerator

LvFindBy_UserID Can be used in the [LvInterfaceFindDevice\(\)](#) for finding the device by its User ID (nickname).

LvFindBy_VendorName Can be used in the [LvInterfaceFindDevice\(\)](#) for finding the device by its vendor name.

LvFindBy_ModelName Can be used in the [LvInterfaceFindDevice\(\)](#) for finding the device by its model name.

LvFindBy_TLType Can be used in the [LvSystemFindInterface\(\)](#) or [LvInterfaceFindDevice\(\)](#) for finding the interface or device by its Transport Layer type. The search string can be then one of the following:

- "GEV" for GigE Vision,
- "CL" for Camera Link,
- "IIDC" for IIDC 1394,
- "UVC" for USB video class devices,
- "Custom" for not defined ones (for example the New Electronic Technology CorSight streaming device).

LvFindBy_DisplayName Can be used in the [LvSystemFindInterface\(\)](#) or [LvInterfaceFindDevice\(\)](#) for finding the interface or device by its display name.

LvFindBy_GevIPAddress Can be used in the [LvSystemFindInterface\(\)](#) or [LvInterfaceFindDevice\(\)](#) for finding the interface or device by its IP address (in case of the interface, it is the default IP address of the NIC).

LvFindBy_GevMACAddress Can be used in the [LvInterfaceFindDevice\(\)](#) for finding the device by its model name.

LvFindBy_SerialNumber Can be used in the [LvInterfaceFindDevice\(\)](#) for finding the device by its serial number.

LvFindBy_Any Tries to find the string in all available IDs (UserID, VendorName, ModelName...).

Definition at line 6030 of file sv.synview.enums.h.

5.25.2.4 enum LvFtrAccess

LvFtrAccess constants. Define the current feature access mode. Used in the [LvGetAccess\(\)](#). Also used for enumeration features in functions [LvGetEnumValByStr\(\)](#) and [LvGetEnumStrByVal\(\)](#).

Enumerator

LvFtrAccess_NotImplemented The feature is not implemented at all.

LvFtrAccess_NotAvailable The feature is implemented, but under the current conditions is not available.

LvFtrAccess_WriteOnly The feature is available and is write only.

LvFtrAccess_ReadOnly The feature is available and is read only.

LvFtrAccess_ReadWrite The feature is available and is fully accessible.

Definition at line 267 of file sv.synview.enums.h.

5.25.2.5 enum LvFtrGroup

LvFtrGroup constants. Define the group of features. The group is composed of the module and the feature origin. The richest set is belonging to the Device module:

- Device remote features are those, which are provided by the device itself through GenICam GenApi.
- Device GenTL features are those, which are provided by the GenTL library through GenICam GenApi.
- Device local features are those, which are implemented directly in the SynView library. Used in [LvGetNumFeatures\(\)](#), [LvGetFeatureAt\(\)](#), [LvGetFeatureByName\(\)](#).

Enumerator

- LvFtrGroup_DeviceRemote** Device remote features obtained from the device GenApi node tree.
- LvFtrGroup_SystemGtl** System features obtained from the GenTL GenApi node tree.
- LvFtrGroup_InterfaceGtl** Interface features obtained from the GenTL GenApi node tree.
- LvFtrGroup_DeviceGtl** Device features obtained from the GenTL GenApi node tree.
- LvFtrGroup_StreamGtl** Stream features obtained from the GenTL GenApi node tree.
- LvFtrGroup_BufferGtl** Buffer features obtained from the GenTL GenApi node tree.
- LvFtrGroup_SystemLocal** System local features, implemented in SynView.
- LvFtrGroup_InterfaceLocal** Interface local features, implemented in SynView.
- LvFtrGroup_DeviceLocal** Device local features, implemented in SynView.
- LvFtrGroup_StreamLocal** Stream local features, implemented in SynView.
- LvFtrGroup_BufferLocal** Buffer local features, implemented in SynView.
- LvFtrGroup_RendererLocal** Renderer local features, implemented in SynView.
- LvFtrGroup_EventLocal** Event local features, implemented in SynView.
- LvFtrGroup_BufferItemsGtl** Obsolete - will be removed. Buffer local GenTL features obtained from the GenTL plain C API.
- LvFtrGroup_EventItemsGtl** Obsolete - will be removed. Event local GenTL features obtained from the GenTL plain C API.
- LvFtrGroup_SystemHidden** System hidden features. Do not use, reserved for special purposes.
- LvFtrGroup_InterfaceHidden** Interface hidden features. Do not use, reserved for special purposes.
- LvFtrGroup_DeviceHidden** Device hidden features. Do not use, reserved for special purposes.
- LvFtrGroup_StreamHidden** Stream hidden features. Do not use, reserved for special purposes.
- LvFtrGroup_BufferHidden** Buffer hidden features. Do not use, reserved for special purposes.
- LvFtrGroup_RendererHidden** Renderer hidden features. Do not use, reserved for special purposes.
- LvFtrGroup_EventHidden** Event hidden features. Do not use, reserved for special purposes.

Definition at line 136 of file sv.synview.enums.h.

5.25.2.6 enum LvFtrGui

LvFtrGui constants. Define the recommended GUI representation of the feature. Used in the [LvGetType\(\)](#) function.

Enumerator

- LvFtrGui_IntEdit** The recommended representation is an edit box with a decimal value. Used by [LvFtrType_Integer](#).
- LvFtrGui_IntEditHex** The recommended representation is an edit box with a hexadecimal value. Used by [LvFtrType_Integer](#).
- LvFtrGui_IntSlider** The recommended representation is a linear slider. Used by [LvFtrType_Integer](#).

- LvFtrGui_IntSliderLog** The recommended representation is a logarithmic slider. Used by [LvFtrType_Integer](#).
- LvFtrGui_FloatEdit** The recommended representation is an edit box. Used by [LvFtrType_Float](#).
- LvFtrGui_FloatSlider** The recommended representation is a linear slider. Used by [LvFtrType_Float](#).
- LvFtrGui_FloatSliderLog** The recommended representation is a logarithmic slider. Used by [LvFtrType_↔Float](#).
- LvFtrGui_Label** The recommended representation is read-only label. Used by [LvFtrType_Category](#).
- LvFtrGui_StringEdit** The recommended representation is an edit box for a string. Used by [LvFtrType_String](#).
- LvFtrGui_CheckBox** The recommended representation is a check box. Used by [LvFtrType_Boolean](#).
- LvFtrGui_ComboBox** The recommended representation is a combo box. Used by [LvFtrType_Boolean](#).
- LvFtrGui_Button** The recommended representation is a button. Used by [LvFtrType_Command](#).
- LvFtrGui_IpV4Address** The recommended representation is an edit box for a string with an IP address in the form N.N.N.N. Used by [LvFtrType_Integer](#).
- LvFtrGui_IpMacAddress** The recommended representation is an edit box for a string with a MAC address in the form XX:XX:XX:XX:XX:XX. Used by [LvFtrType_Integer](#).
- LvFtrGui_Undefined** The recommended representation is not defined.

Definition at line 225 of file sv.synview.enums.h.

5.25.2.7 enum LvFtrInfo

LvFtrInfo constants. Define the info type when querying for feature info by the [LvGetInfo\(\)](#) and [LvGetInfoStr\(\)](#) functions.

Enumerator

- LvFtrInfo_IsStreamable** Returns 1 if the feature has the Streamable attribute set. To be used in the [LvGet↔Info\(\)](#) function.
- LvFtrInfo_IsWrapped** Returns 1 if the feature should not be used directly, because SynView provides for this functionality a native API. For example the AcquisitionStart and AcquisitionStop device remote features are wrapped by additional functionality in SynView (for example locking TL params before the AcquisitionStart command is issued). To be used in the [LvGetInfo\(\)](#) function.
- LvFtrInfo_IsSelector** Returns 1 if the feature is a selector, that means subsequent features are indexed by it . To be used in the [LvGetInfo\(\)](#) function.
- LvFtrInfo_IsCached** Returns 1 if the feature is cached. To be used in the [LvGetInfo\(\)](#) function.
- LvFtrInfo_PollingTime** Returns the polling time for a non-cached feature. If the feature is dependent on other non-cached features, the returned polling time is the minimum found. The polling time defines recommended time to update the non-cached feature. For example the LvDevice_DeviceTemperature is a typical non-cached feature - it changes independently and a as it changes slowly, the recommended polling time might be 10000 = 10 seconds, i.e. the application, which displays the temperature, should update it on screen every 10 seconds. The returned value -1 means the polling time is not defined. To be used in the [LvGetInfo\(\)](#) function.
- LvFtrInfo_Name** Returns the feature Name. Do not confuse it with the DisplayName - the Name is the string identifier, by which the feature can be identified and a numeric ID can be obtained for further actions (generic feature access). To be used in the [LvGetInfoStr\(\)](#) function.
- LvFtrInfo_DisplayName** Returns the feature Display name for representation in GUI. To be used in the [Lv↔GetInfoStr\(\)](#) function.
- LvFtrInfo_Description** Returns the feature Description text. To be used in the [LvGetInfoStr\(\)](#) function.
- LvFtrInfo_PhysicalUnits** Returns the feature Physical units, if defined. To be used in the [LvGetInfoStr\(\)](#) function.
- LvFtrInfo_ToolTip** Returns the feature Tooltip (a short description to be used in the GUI). To be used in the [LvGetInfoStr\(\)](#) function.

- LvFtrInfo_SymbolicConst** Returns the SynView symbolic constant of the feature, as a string (utilized in the Source code generator). To be used in the [LvGetInfoStr\(\)](#) function.
- LvFtrInfo_SymbolicEnumConst** Returns the SynView symbolic constant of the enumeration feature, as a string (utilized in the Source code generator). To be used in the [LvGetInfoStr\(\)](#) function.
- LvFtrInfo_SelectedFeatures** Returns the string ID of selected features belonging under this selector. Param = index (utilized in the Source code generator). To be used in the [LvGetInfoStr\(\)](#) function.
- LvFtrInfo_SelectingFeatures** Returns the string ID of selecting features under which this feature belongs. Param = index (utilized in the Source code generator). To be used in the [LvGetInfoStr\(\)](#) function.
- LvFtrInfo_SymbolicGroupConst** Returns the SynView symbolic constant for the feature group, to which the feature belongs, as a string (utilized in the Source code generator). To be used in the [LvGetInfoStr\(\)](#) function.
- LvFtrInfo_ModuleName** Returns the string indicating the type of module, to which the feature belongs, for example "System", "Interface", "Device", ... (utilized in the Source code generator). To be used in the [LvGetInfoStr\(\)](#) function.
- LvFtrInfo_FitsTo32Bit** Returns 1 if for this feature can be safely used 32-bit integer instead of 64-bit (if the feature is of the LvFtrType_Integer type). This info is utilized in the source code generator. To be used in the [LvGetInfo\(\)](#) function.
- LvFtrInfo_TakeAsReadOnly** Returns 1 if this feature is either permanently read-only (cannot become read-write depending on other features), or the feature is writable, but it is not usual to set its value from code. This info is utilized in the source code generator. To be used in the [LvGetInfo\(\)](#) function.
- LvFtrInfo_EnumEntryName** Returns the symbolic name of the enum entry. To be used in the [LvGetInfoStr\(\)](#) function. The Param specifies a zero based index of the entry or the SynView enum entry constant. You can obtain the number of entries by the [LvGetInfo\(\)](#) function with the [LvFtrInfo_EnumEntryCount](#) parameter. If the Param is set to [LV_ENUMENTRY_CURRENT](#), the returned info is for the currently selected enum entry.
- LvFtrInfo_EnumEntryDisplayName** Returns the display name of the enum entry. To be used in the [LvGetInfoStr\(\)](#) function. The Param specifies a zero based index of the entry or the SynView enum entry constant. You can obtain the number of entries by the [LvGetInfo\(\)](#) function with the [LvFtrInfo_EnumEntryCount](#) parameter. If the Param is set to [LV_ENUMENTRY_CURRENT](#), the returned info is for the currently selected enum entry.
- LvFtrInfo_EnumEntryDescription** Returns the description of the enum entry. To be used in the [LvGetInfoStr\(\)](#) function. The Param specifies a zero based index of the entry or the SynView enum entry constant. You can obtain the number of entries by the [LvGetInfo\(\)](#) function with the [LvFtrInfo_EnumEntryCount](#) parameter. If the Param is set to [LV_ENUMENTRY_CURRENT](#), the returned info is for the currently selected enum entry.
- LvFtrInfo_EnumEntryToolTip** Returns the tooltip of the enum entry. To be used in the [LvGetInfoStr\(\)](#) function. The Param specifies a zero based index of the entry or the SynView enum entry constant. You can obtain the number of entries by the [LvGetInfo\(\)](#) function with the [LvFtrInfo_EnumEntryCount](#) parameter. If the Param is set to [LV_ENUMENTRY_CURRENT](#), the returned info is for the currently selected enum entry.
- LvFtrInfo_EnumEntryAccess** Returns the access of the enum entry (one of the [LvFtrAccess](#) constants). To be used in the [LvGetInfo\(\)](#) function. The Param specifies a zero based index of the entry or the SynView enum entry constant. You can obtain the number of entries by the [LvGetInfo\(\)](#) function with the [LvFtrInfo_EnumEntryCount](#) parameter. If the Param is set to [LV_ENUMENTRY_CURRENT](#), the returned info is for the currently selected enum entry.
- LvFtrInfo_EnumEntryValue** Returns the SynView constant for the enum entry (if exists). To be used in the [LvGetInfo\(\)](#) function. The Param specifies a zero based index of the entry. You can obtain the number of entries by the [LvGetInfo\(\)](#) function with the [LvFtrInfo_EnumEntryCount](#) parameter. If the Param is set to [LV_ENUMENTRY_CURRENT](#), the returned info is for the currently selected enum entry.
- LvFtrInfo_EnumEntryCount** Returns the number of enum entries for the enum. To be used in the [LvGetInfo\(\)](#) function.
- LvFtrInfo_EnumEntryNameMaxSize** Returns the maximum string size needed (including terminating zero) for any entry name of the enum. To be used in the [LvGetInfo\(\)](#) function.

- LvFtrInfo_InterfaceID** Returns the string ID of the interface. Param = interface index. This constant can be used only in the [LvSystem](#) module for enumerating unopened interfaces ([LvGetInfoStr\(\)](#) function, as the Feature use [LvSystem_Info](#)).
- LvFtrInfo_InterfaceDisplayName** Returns the Display name of the interface. Param = interface index. This constant can be used only in the [LvSystem](#) module for enumerating unopened interfaces ([LvGetInfoStr\(\)](#) function, as the Feature use [LvSystem_Info](#)).
- LvFtrInfo_InterfaceTIType** Returns the interface Transport layer type. Param = interface index. This constant can be used only in the [LvSystem](#) module for enumerating unopened interfaces ([LvGetInfoStr\(\)](#) function, as the Feature use [LvSystem_Info](#)). For example a standard interface TL type is "GEV" for GigE-Vision devices.
- LvFtrInfo_DeviceID** Returns the string ID of the device. Param = device index. This constant can be used only in the [LvInterface](#) module for enumerating unopened devices ([LvGetInfoStr\(\)](#) function, as the Feature use [LvInterface_Info](#)).
- LvFtrInfo_DeviceVendor** Returns the Vendor name of the device. Param = device index. This constant can be used only in the [LvInterface](#) module for enumerating unopened devices ([LvGetInfoStr\(\)](#) function, as the Feature use [LvInterface_Info](#)).
- LvFtrInfo_DeviceModel** Returns the Model name of the device. Param = device index. This constant can be used only in the [LvInterface](#) module for enumerating unopened devices ([LvGetInfoStr\(\)](#) function, as the Feature use [LvInterface_Info](#)).
- LvFtrInfo_DeviceTIType** Returns the Transport layer type of the device. Param = device index. This constant can be used only in the [LvInterface](#) module for enumerating unopened devices ([LvGetInfoStr\(\)](#) function, as the Feature use [LvInterface_Info](#)).
- LvFtrInfo_DeviceDisplayName** Returns the Display name the device. Param = device index. This constant can be used only in the [LvInterface](#) module for enumerating unopened devices ([LvGetInfoStr\(\)](#) function, as the Feature use [LvInterface_Info](#)).
- LvFtrInfo_DeviceAccessStatus** Returns the device access status. Param = device index. The returned value is one of the [LvDeviceAccessStatus](#) constants. Can be used only in the [LvInterface](#) module for enumerating unopened devices ([LvGetInfo\(\)](#) function, as the Feature use [LvInterface_Info](#)).

Definition at line 284 of file sv.synview.enums.h.

5.25.2.8 enum LvFtrType

LvFtrType constants. Define the type of the feature. Used in the [LvGetType\(\)](#) function.

Enumerator

- LvFtrType_Integer** Integer type, use [LvGetInt32\(\)](#), [LvSetInt32\(\)](#), [LvGetInt64\(\)](#), [LvSetInt64\(\)](#) to get/set a value.
- LvFtrType_Float** Float type, use [LvGetFloat\(\)](#) and [LvSetFloat\(\)](#) to get/set a value.
- LvFtrType_String** String type, use [LvGetString\(\)](#) and [LvSetString\(\)](#) to get/set a value.
- LvFtrType_Enumeration** Enumeration type, use [LvGetEnum\(\)](#), [LvSetEnum\(\)](#), [LvGetEnumStr\(\)](#) and [LvSetEnumStr\(\)](#) to get/set a value.
- LvFtrType_Boolean** Boolean type, use [LvGetInt32\(\)](#) and [LvSetInt32\(\)](#) to get/set a value.
- LvFtrType_Command** Command type, use [LvCmdExecute\(\)](#) and [LvCmdIsDone\(\)](#) to execute and check.
- LvFtrType_Category** Category type, used in the tree of feaures build.
- LvFtrType_StringList** String list type (multiple strings in one, separated by terminating 0), use [LvGetString\(\)](#) and [LvSetString\(\)](#) to get/set a value.
- LvFtrType_Pointer** Pointer type, use [LvGetPtr\(\)](#) and [LvSetPtr\(\)](#) to get/set a value.
- LvFtrType_Buffer** Buffer type (in GenICam it corresponds with the Register type), use [LvGetBuffer\(\)](#) and [LvSetBuffer\(\)](#) to get/set a value. Do not confuse it with the [LvBuffer](#) module.
- LvFtrType_Other** Unknown type, cannot be accessed.

Definition at line 183 of file sv.synview.enums.h.

5.25.2.9 enum LvFtrVisibility

LvFtrVisibility constants. Define the visibility level of the feature. Used in [LvGetVisibility\(\)](#). Should be used for displaying the feature tree (or list).

Enumerator

- LvFtrVisibility_Beginner** Beginner level - the feature should be displayed always.
- LvFtrVisibility_Expert** Expert level - the feature should be displayed if at least the Expert level is selected.
- LvFtrVisibility_Guru** Guru level - the feature should be displayed if at least the Guru level is selected.
- LvFtrVisibility_Invisible** Invisible - the feature should not be displayed.

Definition at line 251 of file sv.synview.enums.h.

5.25.2.10 enum LvInfoDataType

LvInfoDataType constants. The enum is used only by the [LvEventGetDataInfo\(\)](#) function - this function follows the GenTL EventGetDataInfo() function, which uses different data types, than the GenApi.

Enumerator

- LvInfoDataType_Unknown** Represents the GenTL INFO_DATATYPE_UNKNOWN info - Unknown data type.
- LvInfoDataType_String** Represents the GenTL INFO_DATATYPE_STRING info - 0-terminated C string (ASCII encoded).
- LvInfoDataType_StringList** Represents the GenTL INFO_DATATYPE_STRINGLIST info - Concatenated INFO_DATATYPE_STRING list. End of list is signaled with an additional 0.
- LvInfoDataType_Int16** Represents the GenTL INFO_DATATYPE_INT16 info - Signed 16 bit integer.
- LvInfoDataType_UInt16** Represents the GenTL INFO_DATATYPE_UINT16 info - unsigned 16 bit integer.
- LvInfoDataType_Int32** Represents the GenTL INFO_DATATYPE_INT32 info - signed 32 bit integer.
- LvInfoDataType_UInt32** Represents the GenTL INFO_DATATYPE_UINT32 info - unsigned 32 bit integer.
- LvInfoDataType_Int64** Represents the GenTL INFO_DATATYPE_INT64 info - signed 64 bit integer.
- LvInfoDataType_UInt64** Represents the GenTL INFO_DATATYPE_UINT64 info - unsigned 64 bit integer.
- LvInfoDataType_Float64** Represents the GenTL INFO_DATATYPE_FLOAT64 info - Signed 64 bit floating point number.
- LvInfoDataType_Ptr** Represents the GenTL INFO_DATATYPE_PTR info - Pointer type (void*). Size is platform dependent (32 bit on 32 bit platforms).
- LvInfoDataType_Bool** Represents the GenTL INFO_DATATYPE_BOOL8 info - Boolean value occupying 8 bit. 0 for false and anything for true.
- LvInfoDataType_SizeT** Represents the GenTL INFO_DATATYPE_SIZE_T info - Platform dependent unsigned integer (32 bit on 32 bit platforms).
- LvInfoDataType_Buffer** Represents the GenTL INFO_DATATYPE_BUFFER info - Like the INFO_DATATYPE_STRING but with arbitrary data and no 0 termination.

Definition at line 3689 of file sv.synview.enums.h.

5.25.2.11 enum LvLibInfo

Enum values for the Info parameter of the [LvGetLibInfo\(\)](#), [LvGetLibInfoStr\(\)](#) and [LvGetLibInfoStrSize\(\)](#) functions.

Enumerator

- LvInfo_BinPath** Returns the full path to the SynView binaries (applications and libraries - in Windows the Bin folder of SynView). LvFtrType_String.

LvInfo_AppDataPath Returns the full path to the SynView application data. This folder may be different from the BinPath, for example in Windows Vista the BinPath is write protected, while AppDataPath is at the read-write location and contains files like sv.synview.log etc. LvFtrType_String.

LvInfo_UserDataPath Returns the full path to the SynView user data. In Windows this is equal to AppDataPath. LvFtrType_String.

LvInfo_CfgPath Returns the full path to the SynView config data. In Windows this is equal to AppDataPath. LvFtrType_String.

LvInfo_InstPath Returns the full path to the SynView installation root folder. LvFtrType_String.

LvInfo_IniFile Returns the full path to the lv.SynView.ini file. LvFtrType_String.

LvInfo_BuildDate Returns the build date of the library.

Definition at line 82 of file sv.synview.enums.h.

5.25.2.12 enum LvQueueOperation

LvQueueOperation constants. Define enum values for the [LvStreamFlushQueue\(\)](#) function.

Enumerator

LvQueueOperation_InputToOutput Represents the GenTL ACQ_QUEUE_INPUT_TO_OUTPUT. Flushes the input pool to the output queue and if necessary adds entries in the LvEventType_NewBuffer event data queue.

LvQueueOperation_OutputDiscard Represents the GenTL ACQ_QUEUE_OUTPUT_DISCARD. Discards all buffers in the output queue and if necessary removes the entries from the event data queue.

LvQueueOperation_AllToInput Represents the GenTL ACQ_QUEUE_ALL_TO_INPUT. Puts all buffers in the input pool. Even those in the output queue and discard entries in the event data queue.

LvQueueOperation_UnqueuedToInput Represents the GenTL ACQ_QUEUE_UNQUEUED_TO_INPUT. Puts all buffers that are not in the input pool or the output queue in the input pool.

LvQueueOperation_AllDiscard Represents the GenTL ACQ_QUEUE_ALL_DISCARD. Discards all buffers in the input pool and output queue.

Definition at line 3748 of file sv.synview.enums.h.

5.25.2.13 enum LvRenderFlags

The flags passed as parameter to the functions [LvRendererDisplayImage\(\)](#) and [LvRendererRepaint\(\)](#).

Enumerator

LvRenderFlags_RepaintBackground Before painting the image, the window background is repainted. This is done automatically whenever the change of the window size is detected, or display mode is switched. You can also call [LvRendererDisplayImage\(\)](#) with 0 as the buffer handle and this flag just to erase image painting area.

LvRenderFlags_DontPaintIncomplete If the buffer LvBuffer_IsIncomplete feature is true, it is not painted. The IsIncomplete feature indicates the contents of the buffer is a mixture of new and old image data, typically it happens when some packets with image data from a GigE camera are lost. If this flag is set simply the paint or repaint of such buffer is skipped, leaving whatever was before on the screen.

LvRenderFlags_IgnoreInvalidWinHandle This flag has a meaning only for the [LvRendererCanDisplayImage\(\)](#) function. If used, this function will not return an error if the window handle was not yet assigned by the [LvRendererSetWindow\(\)](#) function. This can be utilized for checking if the image is displayable before the display window is actually used.

[LvIpTextAttr_ShadowT](#), [LvIpTextAttr_ShadowR](#), [LvIpTextAttr_ShadowL](#) }

5.27.1 Detailed Description

5.27.2 Macro Definition Documentation

5.27.2.1 `#define LVIP_LUT_BAYER`

If the LUT is to be used in [Bayer decoding/encoding functions](#), this attribute is to be OR-ed to the [LvIpLutType](#) specification in the [LvIpAllocateLut\(\)](#) function Bayer LUT requires bigger size - is needed for the bilinear interpolation methods and for 10- and 12-bit source formats.

Definition at line 6642 of file `sv.synview.enums.h`.

5.27.2.2 `#define LVIP_LUT_BAYER_16`

Bayer16 is a subset of [LVIP_LUT_BAYER](#), suitable for all 10- and 12-bit decoding, with the exception of [LvIpBd↔
BilinearInterpolation\(\)](#) function.

Definition at line 6647 of file `sv.synview.enums.h`.

5.27.3 Enumeration Type Documentation

5.27.3.1 enum LvipColor

Color definitions for the Overlay functions.

Enumerator

LvipColor_None Defines a non-color. This is useful for the transparent color - specifying the transparent color as LvipColor_None in LvipSetOverlayTransparentColor() switches off overlay transparency.

Definition at line 6685 of file sv.synview.enums.h.

5.27.3.2 enum LvipImgAttr

Image attributes. Flags to be used in the Attributes of the [LvipImgInfo](#) structure.

Enumerator

LvipImgAttr_BottomUp Lines in the image buffer are ordered from the bottom line to the top line, so the image bufer begins with the bottom line.

LvipImgAttr_DWordAligned The line increment is aligned to double word (32 bits). This is required for example by the Windows Device Independent Bitmap format (DIB, BMP) This attribute is used only in the [LvipInitImgInfo\(\)](#) function (which can be called as a result of the LvipOption_ReallocateDst attribute).

LvipImgAttr_QWordAligned The line increment is aligned to quad word (64 bits). This attribute is used in the [LvipInitImgInfo\(\)](#) function (which can be called as a result of the LvipOption_ReallocateDst attribute).

LvipImgAttr_SSEAligned The line increment is aligned to SSE words (128 bits). This attribute is used in the [LvipInitImgInfo\(\)](#) function (which can be called as a result of the LvipOption_ReallocateDst attribute).

LvipImgAttr_Supervised The Image buffer is secured by means of check words and tested for buffer corruption.

LvipImgAttr_NotDataOwner The [LvipImgInfo](#) is not the owner of image data, so the [LvipDeallocateImageData\(\)](#) function will not attempt to deallocate the image data. This attribute is used when the image data are owned by another [LvipImgInfo](#) or belonging to other code, for example when working directly with the image in the DMA buffer. Note that [LvipDeallocateImageData\(\)](#) may be called from other functions, for example, when you use the [LvipOption_ReallocateDst](#) attribute.

Definition at line 6547 of file sv.synview.enums.h.

5.27.3.3 enum LvipLutType

LUT type - to be used in the [LvipAllocateLut\(\)](#) function.

Enumerator

LvipLutType_Uni LUT which internally contains 3 LUTs: 8-bit, 10-bit and 12-bit. All the LUTs are kept synchronized.

LvipLutType_8Bit 8-bit LUT type, used for images with [LvPixelFormat_Mono8](#).

LvipLutType_10Bit 10-bit LUT type, used for images with [LvPixelFormat_Mono10](#).

LvipLutType_12Bit 12-bit LUT type, used for images with [LvPixelFormat_Mono12](#)

LvipLutType_UniBayer LvipLutType_Uni type with the [LVIP_LUT_BAYER](#).

LvipLutType_8BitBayer LvipLutType_8Bit type with the [LVIP_LUT_BAYER](#).

LvipLutType_10BitBayer LvipLutType_10Bit type with the [LVIP_LUT_BAYER](#).

LvipLutType_12BitBayer LvipLutType_12Bit type with the [LVIP_LUT_BAYER](#).

LvipLutType_UniBayer16 LvipLutType_Uni type with the [LVIP_LUT_BAYER_16](#).

LvipLutType_10BitBayer16 LvipLutType_10Bit type with the [LVIP_LUT_BAYER_16](#).

LvipLutType_12BitBayer16 LvipLutType_12Bit type with the [LVIP_LUT_BAYER_16](#).

Definition at line 6652 of file sv.synview.enums.h.

5.27.3.4 enum LvipOption

Options for image processing functions in the Options parameter.

Enumerator

LvipOption_ReallocateDst The destination image data can be reallocated if it is needed. If the function stores a result of the operation to the destination image buffer, it first checks if the destination [LvipImgInfo](#) has appropriate parameters and the buffer(s) allocated. If not and this attribute is specified, it adapts the parameters of the [LvipImgInfo](#) and reallocates the buffer as needed. If this attribute is not specified, the function returns an error in case of mismatch.

LvipOption_TiffConvertTo16Bit The attribute will force conversion of the image to 16-bit mono format, if it is in 9- to 15-bit mono format. This can be used used when saving mono image to TIFF by the [LvipSaveToTiff\(\)](#) function, as many software packages do not understand mono TIFF if it is in 9- to 15-bit mono format.

LvipOption_BmpForceTopDown The BMP file will be read to the top-down line layout. This attribute is used in the [LvipLoadFromBmp\(\)](#) and [LvipSaveToBmp\(\)](#) functions, as the BMP format can be either in the bottom-up line layout or in the top-down line layout.

LvipOption_BmpForceBottomUp The BMP file will be read to the bottom-up line layout. This attribute is used in the [LvipLoadFromBmp\(\)](#) and [LvipSaveToBmp\(\)](#) functions, as the BMP format can be either in the bottom-up line layout or in the top-down line layout.

LvipOption_JpegConvertToBgr The color JPEG images are stored in RGB format (24-bit). With this option the pixel format will be reversed to the BGR format in the [LvipLoadFromJpg\(\)](#) function.

LvipOption_JpegReadHeaderOnly The JPEG image data will not be read, only the header will be read. This enables to allocate the image buffer and then read the full image.

LvipOption_WbCorrectFactors This attribute can be used in the [LvipCalcWbFactors\(\)](#) function. If present, it is assumed that the white balance is calculated from the image to which were applied white balancing factors passed as input parameters. Thus only a correction is calculated and the existing factors are modified.

Definition at line 6592 of file sv.synview.enums.h.

5.27.3.5 enum LvipTextAttr

Text attributes definitions for the Overlay functions.

Enumerator

LvipTextAttr_Bold Bold text. Text attribute for the [LvipSetOverlayTextParams\(\)](#) function: Bold text

LvipTextAttr_Italic Italics text. Text attribute for the [LvipSetOverlayTextParams\(\)](#) function: Italics text

LvipTextAttr_Underline Underlined text. Text attribute for the [LvipSetOverlayTextParams\(\)](#) function: Underlined text

LvipTextAttr_Strikeout Strikeout text. Text attribute for the [LvipSetOverlayTextParams\(\)](#) function: Strikeout text

LvipTextAttr_Nonantialiased Text antialiasing off. Text attribute for the [LvipSetOverlayTextParams\(\)](#) function: Text antialiasing will be switched off - this is useful for text on transparent background, where antialiasing (like ClearType) can make undesirable effects.

LvipTextAttr_Shadow Text with a 1 pixel shadow. Text attribute for the [LvipSetOverlayTextParams\(\)](#) function: Text with a 1 pixel shadow at right-bottom direction.

LvipTextAttr_Outline Text with a 1 pixel outline. Text attribute for the LvipSetOverlayTextParams() function: Text with a 1 pixel outline around the letters. This is useful namely for the text on transparent background - by adding the outline of different color, then the text is readable even if the background become of the same color, as the text.

LvipTextAttr_ShadowRB Text with a 1 pixel shadow at right-bottom direction. Text attribute for the LvipSetOverlayTextParams() function: Text with a 1 pixel shadow at right-bottom direction (equal to [LvipTextAttr_Shadow](#) constant). This constant can be combined with other LvipTextAttr_ShadowXX constants.

LvipTextAttr_ShadowRT Text with a 1 pixel shadow at right-top direction. Text attribute for the LvipSetOverlayTextParams() function: Text with a 1 pixel shadow at right-top direction. This constant can be combined with other LVIP_TEXTATTR_SHADOW_x constants.

LvipTextAttr_ShadowLB Text with a 1 pixel shadow at left-bottom direction. Text attribute for the LvipSetOverlayTextParams() function: Text with a 1 pixel shadow at left-bottom direction. This constant can be combined with other LVIP_TEXTATTR_SHADOW_x constants.

LvipTextAttr_ShadowLT Text with a 1 pixel shadow at left-top direction. Text attribute for the LvipSetOverlayTextParams() function: Text with a 1 pixel shadow at left-top direction. This constant can be combined with other LVIP_TEXTATTR_SHADOW_x constants.

LvipTextAttr_ShadowB Text with a 1 pixel shadow at bottom direction. Text attribute for the LvipSetOverlayTextParams() function: Text with a 1 pixel shadow at bottom direction. This constant can be combined with other LVIP_TEXTATTR_SHADOW_x constants.

LvipTextAttr_ShadowT Text with a 1 pixel shadow at top direction. Text attribute for the LvipSetOverlayTextParams() function: Text with a 1 pixel shadow at top direction. This constant can be combined with other LVIP_TEXTATTR_SHADOW_x constants.

LvipTextAttr_ShadowR Text with a 1 pixel shadow at right direction. Text attribute for the LvipSetOverlayTextParams() function: Text with a 1 pixel shadow at right direction. This constant can be combined with other LVIP_TEXTATTR_SHADOW_x constants.

LvipTextAttr_ShadowL Text with a 1 pixel shadow at left direction. Text attribute for the LvipSetOverlayTextParams() function: Text with a 1 pixel shadow at left direction. This constant can be combined with other LVIP_TEXTATTR_SHADOW_x constants.

Definition at line 6700 of file sv.synview.enums.h.

5.28 Definitions for Enumeration Entry Info

Macros

- `#define LV_ENUMENTRY_CURRENT`

Typedefs

- typedef `LvHModule LvHSystem`
- typedef `LvHModule LvHInterface`
- typedef `LvHModule LvHDevice`
- typedef `LvHModule LvHStream`
- typedef `LvHModule LvHEvent`
- typedef `LvHModule LvHRenderer`
- typedef `LvHModule LvHBuffer`
- typedef `uint32_t LvHOverlay`
- typedef `uint32_t LvFeature`
- typedef `uint32_t LvEnum`

5.28.1 Detailed Description

5.28.2 Macro Definition Documentation

5.28.2.1 `#define LV_ENUMENTRY_CURRENT`

If used as Param of the `LvGetInfo()`, `LvGetInfoStr()` and `LvGetInfoStrSize()` the returned value is for the current enum entry.

Definition at line 231 of file `sv.synview.defs.h`.

5.28.3 Typedef Documentation

5.28.3.1 `typedef uint32_t LvEnum`

Base typedef for the entry of the enumeration item.

Definition at line 278 of file `sv.synview.defs.h`.

5.28.3.2 `typedef uint32_t LvFeature`

Base typedef for the ID of the feature.

Definition at line 277 of file `sv.synview.defs.h`.

5.28.3.3 `typedef LvHModule LvHBuffer`

Typedef for a handle to the Buffer module.

Definition at line 273 of file `sv.synview.defs.h`.

5.28.3.4 `typedef LvHModule LvHDevice`

Typedef for a handle to the Device module.

Definition at line 266 of file `sv.synview.defs.h`.

5.28.3.5 typedef LvHModule LvHEvent

Typedef for a handle to the Event module.

Definition at line 268 of file sv.synview.defs.h.

5.28.3.6 typedef LvHModule LvHInterface

Typedef for a handle to the Interface module.

Definition at line 265 of file sv.synview.defs.h.

5.28.3.7 typedef uint32_t LvHOverlay

Typedef for a handle to the overlay.

Definition at line 275 of file sv.synview.defs.h.

5.28.3.8 typedef LvHModule LvHRenderer

Typedef for a handle to the Renderer module.

Definition at line 269 of file sv.synview.defs.h.

5.28.3.9 typedef LvHModule LvHStream

Typedef for a handle to the Stream module.

Definition at line 267 of file sv.synview.defs.h.

5.28.3.10 typedef LvHModule LvHSystem

Typedef for a handle to the System module.

Definition at line 264 of file sv.synview.defs.h.

5.29.1 Detailed Description

5.29.2 Enumeration Type Documentation

5.29.2.1 enum LvBufferFtr

LvBufferFtr constants.

Enumerator

LvBuffer_Base Represents the GenTL BUFFER_INFO_BASE info - Base address of the buffer memory. LvFtrType_Pointer.

LvBuffer_Size Represents the GenTL BUFFER_INFO_SIZE info - Size of the buffer in bytes. LvFtrType_↔ Integer.

LvBuffer_UserPtr Represents the GenTL BUFFER_INFO_USER_PTR info - The user pointer (supplied by the application when the buffer was allocated). LvFtrType_Pointer. Note: This pointer should not be used in the C++ API and .Net Class Library, where this pointer is utilized internally for the LvBuffer class instance. The actual User pointer is available by the LvBuffer::GetUserPtr() function.

- LvBuffer_TimeStamp** Represents the GenTL BUFFER_INFO_TIMESTAMP info - Timestamp the buffer was acquired. The unit is device/implementation dependent. LvFtrType_Integer.
- LvBuffer_NewData** Represents the GenTL BUFFER_INFO_NEW_DATA info - Flag to indicate that the buffer contains new data since the last delivery. LvFtrType_Boolean.
- LvBuffer_IsQueued** Represents the GenTL BUFFER_INFO_IS_QUEUED info - Flag to indicate if the buffer is in the input pool or output queue. LvFtrType_Boolean.
- LvBuffer_IsAcquiring** Represents the GenTL BUFFER_INFO_ISACQUIRING info - Flag to indicate that the buffer is currently being filled with data. LvFtrType_Boolean.
- LvBuffer_IsIncomplete** Represents the GenTL BUFFER_INFO_ISINCOMPLETE info - Flag to indicate that a buffer was filled, but an error occurred during that process. LvFtrType_Boolean.
- LvBuffer_TIType** Represents the GenTL BUFFER_INFO_TLTYPE info - Transport layer technologies that are supported. LvFtrType_String.
- LvBuffer_SizeFilled** Represents the GenTL BUFFER_INFO_SIZE_FILLED info - Number of bytes written into the buffer last time it has been filled. This value is reset to 0 when the buffer is placed into the Input Buffer Pool. LvFtrType_Integer.
- LvBuffer_Width** Represents the GenTL 1.2 BUFFER_INFO_WIDTH info - Width of the data in the buffer in number of pixels. This information refers for example to the width entry in the GigE Vision image stream data leader. LvFtrType_Integer.
- LvBuffer_Height** Represents the GenTL 1.2 BUFFER_INFO_HEIGHT info - Height of the data in the buffer in number of pixels as configured. For variable size images this is the max Height of the buffer. For example this information refers to the height entry in the GigE Vision image stream data leader. LvFtrType_Integer.
- LvBuffer_XOffset** Represents the GenTL 1.2 BUFFER_INFO_XOFFSET info - XOffset of the data in the buffer in number of pixels from the image origin to handle areas of interest. This information refers for example to the information provided in the GigE Vision image stream data leader. LvFtrType_Integer.
- LvBuffer_YOffset** Represents the GenTL 1.2 BUFFER_INFO_YOFFSET info - YOffset of the data in the buffer in number of lines from the image origin to handle areas of interest. This information refers for example to the information provided in the GigE Vision image stream data leader. LvFtrType_Integer.
- LvBuffer_XPadding** Represents the GenTL 1.2 BUFFER_INFO_XPADDING info - XPadding of the data in the buffer in number of bytes. This information refers for example to the information provided in the GigE Vision image stream data leader. LvFtrType_Integer.
- LvBuffer_YPadding** Represents the GenTL 1.2 BUFFER_INFO_YPADDING info - YPadding of the data in the buffer in number of bytes. This information refers for example to the information provided in the GigE Vision image stream data leader. LvFtrType_Integer.
- LvBuffer_FrameId** Represents the GenTL 1.2 BUFFER_INFO_FRAMEID info - A sequentially incremented number of the frame. This information refers for example to the information provided in the GigE Vision image stream block id. The wrap around of this number is transportation technology dependent. For GigE Vision it is (so far) 16bit wrapping to 1. LvFtrType_Integer.
- LvBuffer_ImagePresent** Represents the GenTL 1.2 BUFFER_INFO_IMAGEPRESENT info - Flag to indicate if the current data in the buffer contains image data. This information refers for example to the information provided in the GigE Vision image stream data leader. LvFtrType_Boolean.
- LvBuffer_ImageOffset** Represents the GenTL 1.2 BUFFER_INFO_IMAGEOFFSET info - Offset of the image data from the beginning of the delivered buffer in bytes. Applies for example when delivering the image as part of chunk data or on technologies requiring specific buffer alignment. LvFtrType_Integer.
- LvBuffer_PayloadType** Represents the GenTL 1.2 BUFFER_INFO_PAYLOADTYPE info - Payload type of the data. This information refers to the constants defined in GenTL PAYLOADTYPE_IDs (UNKNOWN=0, IMAGE=1, RAW_DATA=2, FILE=3, CHUNK_DATA=4, CUSTOM=1000) LvFtrType_Integer.
- LvBuffer_PixelFormat** Represents the GenTL 1.2 BUFFER_INFO_PIXELFORMAT info - This information refers for example to the information provided in the GigE Vision image stream data leader. The interpretation of the pixel format depends on the namespace the pixel format belongs to. This can be inquired using the LvBuffer_PixelFormatNameSpace feature. LvFtrType_Integer.

- LvBuffer_PixelFormatNameSpace** Represents the GenTL 1.2 BUFFER_INFO_PIXELFORMAT_NAMESPACE info - This information refers to the constants defined in GenTL 1.2 PIXELFORMAT_NAMESPACE_IDS to allow interpretation of LvBuffer_PixelFormat (UNKNOWN=0, GEV=1, IIDC=2, CUSTOM=1000). LvFtrType_Integer.
- LvBuffer_DeliveredImageHeight** Represents the GenTL 1.2 BUFFER_INFO_DELIVERED_IMAGEHEIGHT info - The number of lines in the current buffer as delivered by the transport mechanism. For area scan type images this is usually the number of lines configured in the device. For variable size linescan images this number may be lower than the configured image height. This information refers for example to the information provided in the GigE Vision image stream data trailer. LvFtrType_Integer.
- LvBuffer_DeliveredChunkPayloadSize** Represents the GenTL 1.2 BUFFER_INFO_DELIVERED_CHUNKPAYLOADSIZE info - This information refers for example to the information provided in the GigE Vision image stream data leader. LvFtrType_Integer.
- LvBuffer_ChunkLayoutId** Represents the GenTL 1.2 BUFFER_INFO_CHUNKLAYOUTID info - This information refers for example to the information provided in the GigE Vision image stream data leader. The chunk layout id serves as an indicator that the chunk layout has changed and the application should re-parse the chunk layout in the buffer. When a chunk layout (availability or position of individual chunks) changes since the last buffer delivered by the device through the same stream, the device MUST change the chunk layout id. As long as the chunk layout remains stable, the camera MUST keep the chunk layout id intact. When switching back to a layout, which was already used before, the camera can use the same id again or use a new id. A chunk layout id value of 0 is invalid. It is reserved for use by cameras not supporting the layout id functionality. LvFtrType_Integer.
- LvBuffer_FileName** Represents the GenTL 1.2 BUFFER_INFO_FILENAME info - This information refers for example to the information provided in the GigE Vision image stream data leader. For other technologies this is to be implemented accordingly. Since this is GigE Vision related information and the filename in GigE Vision is UTF8 coded, this filename is also UTF8 coded. LvFtrType_Integer.
- LvBuffer_UniBase** Unified base address of the buffer. If the image was processed to the output buffer, the pointer to the output buffer is returned, otherwise the pointer to the acquisition buffer is returned. This enables to write simple universal code for image handling. LvFtrType_Pointer. SynView feature.
- LvBuffer_UniSize** Size of the buffer returned on LvBuffer_UniBase call. LvFtrType_Integer. SynView feature.
- LvBuffer_ProcessBase** Pointer to the process buffer, attached to this acquisition buffer. LvFtrType_Pointer. SynView feature.
- LvBuffer_ProcessSize** Size of the process buffer, attached to this acquisition buffer. LvFtrType_Integer. SynView feature.
- LvBuffer_ExecProcess** Executes the SW image processing of the buffer. To be used when the LvDevice_LvUniProcessExecution is set to LvUniProcessExecution_OnExplicitRequest. LvFtrType_Command. SynView feature.
- LvBuffer_UniImageOffset** Unified image offset. If the image was processed to the output buffer, the image offset to the output buffer is returned, otherwise the image offset to the acquisition buffer is returned. This enables to write simple universal code for image handling. LvFtrType_Integer. SynView feature.
- LvBuffer_ExecProcessCopy** Executes the SW image processing of the buffer with copy to attached process buffer. To be used when the LvDevice_LvUniProcessExecution is set to LvUniProcessExecution_OnExplicitRequest. LvFtrType_Command. SynView feature.

Definition at line 3473 of file sv.synview.enums.h.

5.29.2.2 enum LvDeviceFtr

LvDeviceFtr constants.

Enumerator

- LvDevice_DeviceVendorName** Name of the manufacturer of the device. LvFtrType_String. Device remote feature (LvFtrGroup_DeviceRemote).

- LvDevice_DeviceModelName** Model name of the device. [LvFtrType_String](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_DeviceManufacturerInfo** Manufacturer information about the device. [LvFtrType_String](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_DeviceVersion** Version of the device. [LvFtrType_String](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_DeviceFirmwareVersion** Version of the firmware loaded in the device. [LvFtrType_String](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvRecoveryFirmwareVersion** String that indicates the version of the firmware and software to which the device would recover. [LvFtrType_String](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_DeviceSerialNumber** Device identifier (serial number). [LvFtrType_String](#). Note: This feature is called DeviceID in the SFNC, but we use rather the DeviceSerialNumber in order not to confuse it with the GenTL DeviceID, which is used for the device opening. Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_DeviceUserID** User-programmable device identifier. [LvFtrType_String](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvSensorID** Serial number of the sensor board. [LvFtrType_String](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvGrabberID** Serial number of the grabber board. [LvFtrType_String](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_DeviceScanType** Scan type of the sensor. [LvFtrType_Enumeration](#). Values: [LvDeviceScanType](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_DeviceRegistersStreamingStart** Prepare the device for registers streaming without checking for consistency. [LvFtrType_Command](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_DeviceRegistersStreamingEnd** Announce the end of registers streaming. This will do a register set validation for consistency and activate it. [LvFtrType_Command](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_DeviceRegistersCheck** Perform the validation of the current register set for consistency. [LvFtrType_Command](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_DeviceRegistersValid** Reports if the current register set is valid and consistent. [LvFtrType_Boolean](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_DeviceReset** Resets the device and to put it in its power up state. [LvFtrType_Command](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_DeviceClockSelector** Selects a device clock frequency to be configured. [LvFtrType_Enumeration](#). Values: [LvDeviceClockSelector](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_DeviceClockFrequency** Frequency of the selected clock in Hz. [LvFtrType_Float](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_DeviceTemperatureSelector** Selects the location within the device, where the temperature will be measured. [LvFtrType_Enumeration](#). Values: [LvDeviceTemperatureSelector](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_DeviceTemperature** Current temperature at the selected location in degrees of Celcius [LvFtrType_Float](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvDeviceUpTime** Current up-time of the device in milliseconds. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvDeviceType** String that indicates the basic type of the device. [LvFtrType_String](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_SensorWidth** Effective width of the sensor in pixels. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_SensorHeight** Effective height of the sensor in pixels. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).

- LvDevice_WidthMax** Maximum width of the image in pixels. The dimension is calculated after applying horizontal binning, decimation or readout width. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_HeightMax** Maximum height of the image in pixels. The dimension is calculated after applying vertical binning, decimation or readout height. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_Width** Image width provided by the device in pixels. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_Height** Image height provided by the device in pixels. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_OffsetX** Horizontal offset from the origin of the AOI (area of interest) in pixels. The AOI is applied to the result of binning and or decimation. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_OffsetY** Vertical offset from the origin of the AOI (area of interest) in pixels. The AOI is applied to the result of binning and or decimation. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_PixelFormat** Pixel format provided by the device. The feature combines pixel coding, size and color filter attributes. [LvFtrType_Enumeration](#). Values: see [LvPixelFormat](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_BinningHorizontal** Horizontal binning, number of horizontal pixels to combine together. This increases the intensity (and S/N ratio) of the pixels and reduces the horizontal resolution (width) of the image. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_BinningVertical** Vertical binning, number of vertical pixels to combine together. This increases the intensity (and S/N ratio) of the pixels and reduces the vertical resolution (height) of the image. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_DecimationHorizontal** Horizontal decimation (sub-sampling) of the image. This reduces the horizontal resolution (width) of the image by the specified factor. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_DecimationVertical** Vertical decimation (sub-sampling) of the image. This reduces the vertical resolution (height) of the image by the specified factor. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvAOIMode** Selects the mode of controlling the area of interest [LvFtrType_Enumeration](#). Values: [LvAOIMode](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvReadoutWidth** Width of the sensor-side area of interest in pixels. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvReadoutHeight** Height of the sensor-side area of interest in pixels. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvReadoutOffsetX** X offset (left offset) for the sensor-side area of interest in pixels. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvReadoutOffsetY** Y offset (top offset) for the sensor-side area of interest in pixels. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvVariablePayloadSize** This flag controls, whether the payload size can change during acquisition. When set, the image dimensions and other parameters can vary during acquisition. [LvFtrType_Boolean](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_AcquisitionMode** Sets the acquisition mode of the device. It defines mainly the number of frames to capture during an acquisition and the way the acquisition stops. [LvFtrType_Enumeration](#). Values: [LvAcquisitionMode](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_TriggerSelector** Selects the type of trigger to configure. [LvFtrType_Enumeration](#). Values: [LvTriggerSelector](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_TriggerMode** Controls if the selected trigger is active. [LvFtrType_Enumeration](#). Values: [LvTriggerMode](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_TriggerSoftware** Generates a software trigger when trigger source is set to 'software' or any physical line. [LvFtrType_Command](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).

- LvDevice_TriggerSource** Specifies the internal signal or physical input line to use as the trigger source. [LvFtrType_Enumeration](#). Values: [LvTriggerSource](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_TriggerActivation** Activation mode of the trigger - specifies which edge of the signal is active. [LvFtrType_Enumeration](#). Values: [LvTriggerActivation](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_TriggerDelay** Trigger delay in microseconds, specifies a delay introduced between the trigger reception and its actual activation. [LvFtrType_Float](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_TriggerDivider** Used to divide the number of incoming trigger pulses by an integer factor. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvTriggerCaching** Sets the caching mode for the selected trigger. The feature controls how early triggers are treated by the device. [LvFtrType_Enumeration](#). Values: [LvTriggerCaching](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ExposureMode** Controls the exposure (shutter) mode applied for each acquisition. [LvFtrType_Enumeration](#). Values: [LvExposureMode](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvLongRangeExposureMode** Switches to mode with wider range of exposure times, but slightly higher jitter. [LvFtrType_Boolean](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvGlobalResetMode** Switches to mode with wider range of exposure times, but slightly higher jitter. [LvFtrType_Boolean](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ExposureTime** Exposure time in microseconds. The feature controls how long are the pixels exposed to illumination. [LvFtrType_Float](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ExposureAuto** Selects the automatic exposure mode. [LvFtrType_Enumeration](#). Values: [LvExposureAuto](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvAcquisitionFrameRateControlMode** Switches the acquisition frame rate control on or off. The camera might internally switch to different working mode, which can decrease the maximum frame rate. [LvFtrType_Enumeration](#). Values: [LvAcquisitionFrameRateControlMode](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_AcquisitionFrameRate** Acquisition frame rate in frames per second (Hz) - the frequency with which the image frames are captured. [LvFtrType_Float](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LineSelector** Selects the I/O line for querying and configuration. Note that to use given line to drive a device feature (trigger, counter, etc.), source of the given feature has to refer to the line. [LvFtrType_Enumeration](#). Values: [LvLineSelector](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LineMode** Line mode - controls, whether given line is used as signal input or output. [LvFtrType_Enumeration](#). Values: [LvLineMode](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LineFormat** This feature controls the current electrical format of the selected physical input or output Line. [LvFtrType_Enumeration](#). Values: [LvLineFormat](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LineSource** Selects a device internal signal that should drive the output signal of the selected line. LineMode must be Output. Not applicable for input lines. [LvFtrType_Enumeration](#). Values: [LvLineSource](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LineInverter** Inverts the signal output on the selected line. [LvFtrType_Boolean](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LineStatus** Reports the current status of the selected line. [LvFtrType_Boolean](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LineStatusAll** Bit field indicating status of all i/o lines. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_UserOutputSelector** Selects the user output for querying and configuration. [LvFtrType_Enumeration](#). Values: [LvUserOutputSelector](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_UserOutputValue** Reports the current status of the selected user output. [LvFtrType_Boolean](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).

- LvDevice_UserOutputValueAll** Bit field indicating status of all user outputs. Only the bits defined in the User Output Value All Mask are used, the others are ignored. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_UserOutputValueAllMask** Mask for the User Output Value All bitfield - defines which bits are used to change a user output value and which are ignored. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_CounterSelector** Selects which counter to configure. [LvFtrType_Enumeration](#). Values: [LvCounterSelector](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvCounterMode** Selects working mode of the selected counter. [LvFtrType_Enumeration](#). Values: [LvCounterMode](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_CounterEventSource** Internal device signal incrementing the selected counter. [LvFtrType_Enumeration](#). Values: [LvCounterEventSource](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_CounterReset** This command resets the selected counter [LvFtrType_Command](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_CounterValue** Reads or sets the current value of the selected counter. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_CounterDuration** Duration (or number of events) before the counter end event is generated and the counter expires. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_TimerSelector** Selects which timer to configure. [LvFtrType_Enumeration](#). Values: [LvTimerSelector](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_TimerDuration** Sets the duration (in microseconds) of the timer active pulse. [LvFtrType_Float](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_TimerDelay** Sets the delay (in microseconds) applied between activating the timer and issuing the timer active signal. [LvFtrType_Float](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_TimerTriggerSource** Internal device signal activating the selected timer. [LvFtrType_Enumeration](#). Values: [LvTimerTriggerSource](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvSpecialPurposeTriggerSelector** Selects the special purpose trigger type to configure. [LvFtrType_Enumeration](#). Values: [LvSpecialPurposeTriggerSelector](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvSpecialPurposeTriggerSource** Specifies the internal signal or physical input line to use as the trigger source. [LvFtrType_Enumeration](#). Values: [LvSpecialPurposeTriggerSource](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvSpecialPurposeTriggerActivation** Activation mode of the trigger - specifies which edge of the signal is active. [LvFtrType_Enumeration](#). Values: [LvSpecialPurposeTriggerActivation](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvSpecialPurposeTriggerSoftware** Generates a software trigger for the selected trigger action when trigger source is set to 'software' or any physical line. [LvFtrType_Command](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvImageStampsResetMask** A single bitfield that selects which features will be reset by the timestamp reset trigger in one access. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvImageStampSelector** Selects an image stamp type for configuration. [LvFtrType_Enumeration](#). Values: [LvImageStampSelector](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvImageStampResetEnable** Enables/disables the reset trigger functionality for the selected image stamp type. [LvFtrType_Boolean](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvBootSwitch** Selects the firmware type to load on next boot. [LvFtrType_Enumeration](#). Values: [LvBootSwitch](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvBayerDecoderAlgorithm** Selects the algorithm used by the Bayer decoder. [LvFtrType_Enumeration](#). Values: [LvBayerDecoderAlgorithm](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvBayerDecoderThreshold** Sets the threshold controlling the performance of the variable gradient Bayer decoder algorithm. [LvFtrType_Float](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).

- LvDevice_LvWatchdogEnable** Enables the watchdog reset function. [LvFtrType_Boolean](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvWatchdogTimerDuration** When watchdog is enabled, the device reboots when the timeout specified expires. [LvFtrType_Float](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvWatchdogTimerReset** Resets the watchdog timer, the watchdog starts counting the specified timeout again. [LvFtrType_Command](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvWatchdogFailed** Signals that the last device reboot was initiated by the watchdog function. After reading, reset this flag explicitly, it wouldn't be affected by a 'warm' system reboot. [LvFtrType_Boolean](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GainSelector** Selects which gain type to configure. [LvFtrType_Enumeration](#). Values: [LvGainSelector](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_Gain** Gain value for the selected gain type in dB. This is an amplification factor applied to the video signal. [LvFtrType_Float](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GainAuto** Controls the automatic gain control (AGC) mode. [LvFtrType_Enumeration](#). Values: [LvGainAuto](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_BlackLevelSelector** Selects which black level type to configure. [LvFtrType_Enumeration](#). Values: [LvBlackLevelSelector](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_BlackLevel** Controls the analog black level. This represents a DC offset applied to the video signal. [LvFtrType_Float](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_BlackLevelAuto** Controls the automatic black level mode. [LvFtrType_Enumeration](#). Values: [LvBlackLevelAuto](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ColorTransformationSelector** Selects which color transformation module is controlled by the color transformation features. It also gives particular meaning to individual color transformation gains. [LvFtrType_Enumeration](#). Values: [LvColorTransformationSelector](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ColorTransformationEnable** Activates the selected Color Transformation module. [LvFtrType_Boolean](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ColorTransformationValueSelector** Selects the gain factor or offset of the transformation matrix to configure [LvFtrType_Enumeration](#). Values: [LvColorTransformationValueSelector](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ColorTransformationValue** Value of the selected color transformation matrix entry. [LvFtrType_Float](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvExternalDeviceControlMode** Selects the operation mode of external device control. [LvFtrType_Enumeration](#). Values: [LvExternalDeviceControlMode](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvExternalADCSelector** Selects the external ADC to configure. [LvFtrType_Enumeration](#). Values: [LvExternalADCSelector](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvExternalADCValue** Reads the value of the selected external ADC. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvPowerSwitchCurrentAction** Reports the automated action currently performed by a power switch. [LvFtrType_Enumeration](#). Values: [LvPowerSwitchCurrentAction](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvPowerSwitchSelector** Selects the power switch to configure. [LvFtrType_Enumeration](#). Values: [LvPowerSwitchSelector](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvPowerSwitchBoundADC** Sets an external ADC to the selected power switch. The bound pair will work together during the automatic operation. [LvFtrType_Enumeration](#). Values: [LvPowerSwitchBoundADC](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvPowerSwitchDrive** Drives the selected power switch with desired polarity. [LvFtrType_Enumeration](#). Values: [LvPowerSwitchDrive](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvPowerSwitchPulsePlus** Pulses the selected power switch with plus polarity. Available in the automatic operation mode. [LvFtrType_Command](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).

- LvDevice_LvPowerSwitchPulseMinus** Pulses the selected power switch with minus polarity. Available in the automatic operation mode. [LvFtrType_Command](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvLensControlCalibrate** Starts an automatic calibration on the selected power switch and bounded ADCs. [LvFtrType_Command](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvLensControlMinusEnd** Represents the calibrated minimal ADC achievable by driving the power switch's with minus polarity (plus if the polarity is inverted). [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvLensControlPlusEnd** Represents the calibrated maximal ADC achievable by driving the power switch's with plus polarity (minus if the polarity is inverted). [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvLensControlPulsePeriod** Represents the calibrated slow motion pulse period for the selected power switch, in microseconds. [LvFtrType_Float](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvLensControlDutyCycle** Represents the calibrated slow motion duty cycle for the selected power switch (in %). Defines how much of the pulse period is the power switch actually active. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvLensControlTargetApproach** Selects how the target lens position should be approached. [LvFtrType_Enumeration](#). Values: [LvLensControlTargetApproach](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvLensControlNrSlowSteps** Sets the number of slow steps required before reaching the target position [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvLensControlTargetPosition** Sets the target position (value) of the ADC bound to the selected power switch [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvLensControlAdjustPosition** Adjusts the required target position (value) of the ADC bound to the selected power switch. [LvFtrType_Command](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvPowerSwitchPulseDuration** Duration (in microseconds) of the pulses issued at the power switch. [LvFtrType_Float](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvLensControlMinCalibrationRange** Minimum value range that has to be reached on the external ADC to count the calibration as valid. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvLensControlCalibrateAll** Starts an automatic calibration on the active power switches and bounded ADCs. [LvFtrType_Command](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LUTSelector** Selects which LUT to configure. [LvFtrType_Enumeration](#). Values: [LvLUTSelector](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LUTEnable** Activates the selected LUT. [LvFtrType_Boolean](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LUTIndex** Index of the element to access in the selected LUT [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LUTValue** Value of the element for the current index in the selected LUT. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LUTValueAll** This register accesses the entire content of the selected LUT in one chunk access. [LvFtrType_Buffer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_PayloadSize** Provides the number of bytes transferred for each image by the device, including image and chunk data. The value defines the required size of the target buffer used for acquisition. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevVersionMajor** Major version of the GigE Vision specification implemented by the device. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevVersionMinor** Minor version of the GigE Vision specification implemented by the device. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevDeviceModelsBigEndian** Endianess of the device registers. [LvFtrType_Boolean](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevDeviceModeCharacterSet** Character set used by all the strings of the device registers. [LvFtrType_Enumeration](#). Values: [LvGevDeviceModeCharacterSet](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).

- LvDevice_GevInterfaceSelector** Selects which physical network interface to control. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevInterfaceMACAddress** MAC address of the network interface. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevSupportedOptionSelector** Selects the GEV option to interrogate for existing support. [LvFtrType_Enumeration](#). Values: [LvGevSupportedOptionSelector](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevSupportedOption** Returns if the selected GEV option is supported. [LvFtrType_Boolean](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevCurrentIPConfigurationLLA** Indicates if Link Local Address IP configuration scheme is activated on the given network interface. [LvFtrType_Boolean](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevCurrentIPConfigurationDHCP** Indicates if DHCP IP configuration scheme is activated on the given network interface. [LvFtrType_Boolean](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevCurrentIPConfigurationPersistentIP** Indicates if persistent IP configuration scheme is activated on the given network interface. [LvFtrType_Boolean](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevCurrentIPAddress** Reports the IP address for the given network interface. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevCurrentSubnetMask** Provides the subnet mask of the given interface. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevCurrentDefaultGateway** Indicates the default gateway IP address to be used on the given network interface. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevPersistentIPAddress** Indicates the persistent IP address for this network interface. It is only used when the device boots with the persistent IP configuration scheme. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevPersistentSubnetMask** Indicates the persistent subnet mask associated with the persistent IP address on this network interface. It is only used when the device boots with the Persistent IP configuration scheme. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevPersistentDefaultGateway** Indicates the persistent default gateway for this network interface. It is only used when the device boots with the persistent IP configuration scheme. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevNumberOfInterfaces** Indicates the number of physical network interfaces supported by this device. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevMessageChannelCount** Indicates the number of message channels supported by this device. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevStreamChannelCount** Indicates the number of stream channels supported by this device. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevHeartbeatTimeout** Indicates the current heartbeat timeout in milliseconds. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevTimestampTickFrequency** Indicates the number of timestamp ticks during 1 second (frequency in Hz). [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevTimestampControlLatch** Latches current timestamp counter into [GevTimestampValue](#). [LvFtrType_Command](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevTimestampControlReset** Resets the Timestamp counter to 0. [LvFtrType_Command](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevTimestampControlLatchReset** Reset and latch in a single command. [LvFtrType_Command](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevTimestampValue** Returns the latched 64-bit value of the timestamp counter. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevCCP** Controls the device access privilege of an application. [LvFtrType_Enumeration](#). Values: [LvGevCCP](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).

- LvDevice_GevStreamChannelSelector** Selects the stream channel to control. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevSCPIInterfaceIndex** Index of network interface to use. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevSCPHostPort** Indicates the port to which the device must send data stream. Setting this value to 0 closes the stream channel. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevSCPSFireTestPacket** Sends a test packet. When this feature is set, the device will fire one test packet. [LvFtrType_Boolean](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevSCPSDoNotFragment** The state of this feature is copied into the "do not fragment" bit of IP header of each stream packet. It can be used by the application to prevent IP fragmentation of packets on the stream channel. [LvFtrType_Boolean](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevSCPSBigEndian** Specifies the stream packet size in bytes to send on this channel. [LvFtrType_Boolean](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevSCPSPacketSize** Specifies the stream packet size in bytes to send on this channel. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevSCPD** Indicates the delay (in timestamp counter unit, which is currently a microsecond) to insert between each packet for this stream channel. This can be used as a crude flow-control mechanism if the application or the network infrastructure cannot keep up with the packets coming from the device. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevSCDA** Indicates the destination IP address for this stream channel. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevLinkSpeed** Indicates the speed of transmission negotiated by the given network interface in Mb/s. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_UserSetSelector** Selects the feature configuration user set to load, save or configure. [LvFtrType_Enumeration](#). Values: [LvUserSetSelector](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_UserSetLoad** Loads the selected user configuration set and makes it active [LvFtrType_Command](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_UserSetSave** Saves the current device configuration into the selected user configuration set. [LvFtrType_Command](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_UserSetDefaultSelector** Selects the default feature configuration set to be loaded and activated upon camera boot or reset. [LvFtrType_Enumeration](#). Values: [LvUserSetDefaultSelector](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ChunkModeActive** Activates the chunk mode, ie. inclusion of chunk data in the payload data. [LvFtrType_Boolean](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ChunkSelector** Selects the chunk to configure. [LvFtrType_Enumeration](#). Values: [LvChunkSelector](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ChunkEnable** Enables the inclusion of the selected chunk in the payload data. [LvFtrType_Boolean](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ChunkOffsetX** X offset applied the image included in the payload. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ChunkOffsetY** Y offset applied the image included in the payload. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ChunkWidth** Width of the image included in the payload. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ChunkHeight** Height of the image included in the payload. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ChunkPixelFormat** Pixel format of the image included in the payload. [LvFtrType_Enumeration](#). Values: see [LvPixelFormat](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ChunkLinePitch** Line pitch of the image included in the payload. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ChunkFrameID** Frame id of the image included in the payload. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).

- LvDevice_ChunkTimestamp** Timestamp associated with the image included in the payload. [LvFtrType_↔Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ChunkExposureTime** Exposure time used to acquire the image included in the payload. [LvFtr↔Type_Float](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ChunkGainSelector** Selects the gain type to be reported in chunk data. [LvFtrType_Enumeration](#). Values: [LvChunkGainSelector](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ChunkGain** Gain used to acquire the image included in the payload. [LvFtrType_Float](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ChunkBlackLevel** Black level used to acquire the image included in the payload. [LvFtrType_Float](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ChunkLineStatusAll** Bit field indicating status of all i/o lines at the time the image included in the payload was acquired. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ChunkLvExternalADCSelector** Selects the external ADC to be reported in chunk data. [LvFtr↔Type_Enumeration](#). Values: [LvChunkLvExternalADCSelector](#). Device remote feature ([LvFtrGroup_↔DeviceRemote](#)).
- LvDevice_ChunkLvExternalADCValue** Reads the value of the selected external ADC at time of acquisition of the image included in the payload. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_Device↔Remote](#)).
- LvDevice_EventSelector** Selects which event to signal to the host application. [LvFtrType_Enumeration](#). Values: [LvEventSelector](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_EventNotification** Activate or deactivate the notification to the host application of the selected event occurrence. [LvFtrType_Enumeration](#). Values: [LvEventNotification](#). Device remote feature ([LvFtr↔Group_DeviceRemote](#)).
- LvDevice_LvSmartAppID** ID string the smart application [LvFtrType_String](#). Device remote feature ([LvFtr↔Group_DeviceRemote](#)).
- LvDevice_LvSmartAppInt1** Generic signed integer register controlling a smart application. [LvFtrType_↔Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvSmartAppInt2** Generic signed integer register controlling a smart application. [LvFtrType_↔Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvSmartAppInt3** Generic signed integer register controlling a smart application. [LvFtrType_↔Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvSmartAppInt4** Generic signed integer register controlling a smart application. [LvFtrType_↔Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvSmartAppInt5** Generic signed integer register controlling a smart application. [LvFtrType_↔Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvSmartAppInt6** Generic signed integer register controlling a smart application. [LvFtrType_↔Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvSmartAppInt7** Generic signed integer register controlling a smart application. [LvFtrType_↔Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvSmartAppInt8** Generic signed integer register controlling a smart application. [LvFtrType_↔Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvSmartAppInt9** Generic signed integer register controlling a smart application. [LvFtrType_↔Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvSmartAppInt10** Generic signed integer register controlling a smart application. [LvFtrType_↔Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvSmartAppInt11** Generic signed integer register controlling a smart application. [LvFtrType_↔Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvSmartAppInt12** Generic signed integer register controlling a smart application. [LvFtrType_↔Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvSmartAppInt13** Generic signed integer register controlling a smart application. [LvFtrType_↔Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).

- LvDevice_LvSmartAppUint32** Generic unsigned integer register controlling a smart application. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvSmartAppAsciiCmdString** Characters of the ASCII command for the smart application. [LvFtrType_String](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvSmartAppAsciiCmdExecute** Executes the ASCII command for the smart application. [LvFtrType_Command](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvSmartAppAsciiCmdFeedback** Response to the ASCII command for the smart application. [LvFtrType_String](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvSmartAppAsciiCmdRetCode** Numeric return code of the ASCII command for the smart application. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvSmartAppPath** Path of the smart application to be started [LvFtrType_String](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvSmartAppStart** Starts the smart application defined by the path. [LvFtrType_Command](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_EventLvLog** Returns the unique identifier of the log type of event. This feature can be used to register a callback function to be notified of the event occurrence. Its value uniquely identifies the type of event that will be received. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_EventLvLogTimestamp** Returns the timestamp of the log event. It can be used to determine precisely when the event occurred. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_EventLvLogMessage** The log message coming with the event [LvFtrType_String](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_EventLvSmartAppLog** Returns the unique identifier of the smart application log type of event. This feature can be used to register a callback function to be notified of the event occurrence. Its value uniquely identifies the type of event that will be received. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_EventLvSmartAppLogTimestamp** Returns the timestamp of the smart application Smart Application Log Event. It can be used to determine precisely when the event occurred. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_EventLvSmartAppLogMessage** The smart application log message coming with the event. [LvFtrType_String](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvSerialPortBaudRate** Baud rate used for the serial port communication. [LvFtrType_Enumeration](#). Values: [LvSerialPortBaudRate](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvSerialPortParity** Parity used for the serial port communication. [LvFtrType_Enumeration](#). Values: [LvSerialPortParity](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvSerialPortDataBits** Data bits per character for the serial port communication. [LvFtrType_Enumeration](#). Values: [LvSerialPortDataBits](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvSerialPortStopBits** Stop bits per character for the serial port communication. [LvFtrType_Enumeration](#). Values: [LvSerialPortStopBits](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvSerialPortTimeout** Timeout value used to finish waiting for command response [LvFtrType_Float](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvSerialPortEOTMarker** Short string (or single character) marking end of transmission. [LvFtrType_String](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvSerialPortMaxResponseLength** Maximal expected length of the command response. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvSerialPortCommandString** String of the ASCII command to be sent over the serial port. [LvFtrType_String](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvSerialPortCommandSend** Sends the ASCII command over the serial port Command. [LvFtrType_Command](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvSerialPortCommandResponse** Response to the ASCII command sent over the serial port StringReg. [LvFtrType_String](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).

- LvDevice_LvSerialPortCommandStatus** Status code indicating success of the last command. Values↔ : [LvSerialPortCommandStatus](#). [LvFtrType_Enumeration](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvSmartAppExitEvent** Sends an exit event to the running smart application. [LvFtrType_Command](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvWatchdogTimerValue** Current watchdog timer value - reports the current value, after which the timer expires and the device reboots. [LvFtrType_Float](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvLensControllInvertedPolarity** Indicates if the lens is wired with inverted polarity, meaning that driving the power switch to the plus side decreases the external ADC feedback. [LvFtrType_Boolean](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevMCPHostPort** Controls the port to which the device must send messages. Setting this value to 0 closes the message channel. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevMCDA** Controls the destination IP address for the message channel. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevMCTT** Provides the transmission timeout value in milliseconds. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevMCRC** Controls the number of retransmissions allowed when a message channel message times out. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ChunkLvSmartAppString** The smart application string related to the delivered payload. [LvFtrType_String](#) Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ChunkLvSmartAppIntSelector** Selects one of the signed integer values related to the delivered payload. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ChunkLvSmartAppInt** The selected smart application signed integer related to the delivered payload. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ChunkLvSmartAppUIntSelector** Selects one of the unsigned integer values related to the delivered payload. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ChunkLvSmartAppUInt** The selected smart application unsigned integer related to the delivered payload. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ChunkLvSmartAppRegister** The smart application raw register related to the delivered payload. [LvFtrType_Buffer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_EventLvSmartAppString** Returns the unique identifier of the smart application string type of event. This feature can be used to register a callback function to be notified of the event occurrence. Its value uniquely identifies the type of event that will be received. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_EventLvSmartAppStringTimestamp** Returns the timestamp of the smart application string event. It can be used to determine precisely when the event occurred. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_EventLvSmartAppStringValue** The smart application string value coming with the event. [LvFtrType_String](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_EventLvSmartAppInt** Returns the unique identifier of the smart application signed integer type of event. This feature can be used to register a callback function to be notified of the event occurrence. Its value uniquely identifies the type of event that will be received. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_EventLvSmartAppIntTimestamp** Returns the timestamp of the smart application signed integer event. It can be used to determine precisely when the event occurred. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_EventLvSmartAppIntSelector** Selects one of the signed integer values coming with the event. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_EventLvSmartAppIntValue** Value of the selected signed integer coming with the event. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).

- LvDevice_EventLvSmartAppUint** Returns the unique identifier of the smart application unsigned integer type of event. This feature can be used to register a callback function to be notified of the event occurrence. Its value uniquely identifies the type of event that will be received. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_EventLvSmartAppUintTimestamp** Returns the timestamp of the smart application unsigned integer event. It can be used to determine precisely when the event occurred. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_EventLvSmartAppUintSelector** Selects one of the unsigned integer values coming with the event. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_EventLvSmartAppUintValue** Value of the selected unsigned integer coming with the event. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_EventLvSmartAppRegister** Returns the unique identifier of the smart application raw register type of event. This feature can be used to register a callback function to be notified of the event occurrence. Its value uniquely identifies the type of event that will be received. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_EventLvSmartAppRegisterTimestamp** Returns the timestamp of the smart application raw register event. It can be used to determine precisely when the event occurred. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_EventLvSmartAppRegisterValue** The smart application raw register value coming with the event Register. [LvFtrType_String](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_DeviceSFNCVersionMajor** Major version of the Standard Feature Naming Convention that was used to create the device's XML. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_DeviceSFNCVersionMinor** Minor version of the Standard Feature Naming Convention that was used to create the device's XML. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_DeviceSFNCVersionSubMinor** Sub-minor version of Standard Feature Naming Convention that was used to create the device's XML. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvLineDebounceDuration** Sets the duration (in microseconds) of the line debounce period. Value of 0.0 switches the debouncer off. [LvFtrType_Float](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ActionDeviceKey** Provides the device key that allows the device to check the validity of action commands. The device internal assertion of an action signal is only authorized if the ActionDeviceKey and the action device key value in the protocol message are equal. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ActionSelector** Selects to which action signal further action settings apply. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ActionGroupKey** Provides the key that the device will use to validate the action on reception of the action protocol message. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ActionGroupMask** Provides the mask that the device will use to validate the action on reception of the action protocol message. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvLensControlCalibrationStatus** Reports current calibration status of the selected power switch and its bound ADC. The status is computed from the current ADC range, no matter if it is a result of calibration operation or configured manually. [LvFtrType_Enumeration](#). Values: [LvLensControlCalibrationStatus](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvLUTMode** Selects the LUT control mode. [LvFtrType_Enumeration](#). Values: [LvLUTMode](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_BalanceRatioSelector** Selects which color channel to configure for white-balancing. [LvFtrType_Enumeration](#). Values: [LvBalanceRatioSelector](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_BalanceRatio** Controls white balance ratio coefficient to be applied on the selected color channel. Note that the white balance functionality is implemented using the LUT. [LvFtrType_Float](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).

- LvDevice_BalanceWhiteAuto** Controls the mode for automatic white balancing between the color channels. The white balancing ratios are automatically adjusted. Note that the white balance functionality is implemented using the LUT. [LvFtrType_Enumeration](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevDeviceClass** Returns the class of the device. [LvFtrType_Enumeration](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevIPConfigurationStatus** Reports the current IP configuration status, ie. the method through which the network interface was configured. [LvFtrType_Enumeration](#). Values: [LvGevIPConfiguration←Status](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevDiscoveryAckDelay** Indicates the maximum randomized delay the device will wait to acknowledge a discovery command. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevGVCPExtendedStatusCodes** Enables the generation of extended status codes. [LvFtrType←_Boolean](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevGVCPPendingAck** Enables the generation of PENDING_ACK. [LvFtrType_Boolean](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevGVCPHeartbeatDisable** Disables the GVCP heartbeat. [LvFtrType_Boolean](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevGVCPPendingTimeout** Indicates the longest GVCP command execution time before a device returns a PENDING_ACK. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevPrimaryApplicationSwitchoverKey** Controls the key to use to authenticate primary application switchover requests. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevPrimaryApplicationSocket** Returns the UDP source port of the primary application. [LvFtr←Type_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevPrimaryApplicationIPAddress** Returns the address of the primary application. [LvFtrType←_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevMCSP** This feature indicates the source port for the message channel. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevSCCFGUnconditionalStreaming** Enables the camera to continue to stream, for this stream channel, if its control channel is closed or regardless of the reception of any ICMP messages (such as destination unreachable messages). [LvFtrType_Boolean](#). Device remote feature ([LvFtrGroup_Device←Remote](#)).
- LvDevice_GevSCCFGExtendedChunkData** Enables cameras to use the extended chunk data payload type for this stream channel. [LvFtrType_Boolean](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevSCPDDirection** Reports the direction of the stream channel. [LvFtrType_Enumeration](#). Values: [LvGevSCPDDirection](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_GevSCSP** Indicates the source port of the stream channel. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ChunkLvTriggerDelayed** Flag indicating if the trigger was delayed when acquiring the image included in the payload. [LvFtrType_Boolean](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_EventLvTriggerDropped** Returns the unique identifier of the dropped trigger type of event. This feature can be used to register a callback function to be notified of the event occurrence. Its value uniquely identifies the type of event that will be received. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup←_DeviceRemote](#)).
- LvDevice_EventLvTriggerDroppedTimestamp** Returns the timestamp of the dropped trigger event. It can be used to determine precisely when the event occurred. [LvFtrType_Integer](#). Device remote feature ([Lv←FtrGroup_DeviceRemote](#)).
- LvDevice_LvStrobeEnable** Selects the LED clusters of the strobe light that should be enabled. [LvFtrType←_Enumeration](#). Values: [LvStrobeEnable](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvStrobeDurationMode** Controls the way how the maximum time of strobe duration is calculated. [LvFtrType_Enumeration](#). Values: [LvStrobeDurationMode](#). Device remote feature ([LvFtrGroup_Device←Remote](#)).

- LvDevice_LvStrobeDuration** Duration of the strobe pulse in usec. The maximum time depends on the setting of Strobe Duration Mode feature. [LvFtrType_Float](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvStrobeDelay** A delay before the strobe pulse starts after frame trigger is applied in usec. [LvFtrType_Float](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvStrobeBrightness** Brightness (in %) of the strobe light. Allows to lower the full brightness of the strobe. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvStrobeDropMode** Sets mode of handling of strobes not matching the device hardware constraints. If a strobe is required (activated by a frame trigger) before the strobe device is ready, the strobe must be dropped or delayed. [LvFtrType_Enumeration](#). Values: [LvStrobeDropMode](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvLUTReset** Resets the LUT settings. [LvFtrType_Command](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ChunkLvStrobeDropped** Flag indicating if the configured strobe was dropped when acquiring the image included in the payload. [LvFtrType_Boolean](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ReverseX** Flip horizontally the image sent by the device. The AOI is applied after the flipping. [LvFtrType_Boolean](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ReverseY** Flip vertically the image sent by the device. The AOI is applied after the flipping. [LvFtrType_Boolean](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_RegionSelector** Selects the region of interest to control. The RegionSelector feature allows devices that are able to extract multiple regions out of an image, to configure the features of those individual regions independently. [LvFtrType_Enumeration](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_RegionMode** Controls if the selected Region of interest is active and streaming. [LvFtrType_Enumeration](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_RegionDestination** Control the destination of the selected region. [LvFtrType_Enumeration](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_AcquisitionFrameCount** Number of frames to acquire in MultiFrame Acquisition mode. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_AcquisitionBurstFrameCount** Number of frames to acquire for each FrameBurstStart trigger. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvCustomID** Revision number of the custom module. [LvFtrType_String](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvCustomInfo** Info register in the custom module. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvCustomRegMode** Controls the way of addressing a register in the custom module. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvCustomRegAddr** Defines the address of a register in the custom module. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvCustomRegData** Transfers data to and from a register in the custom module. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvCustomRegMux** Defines the address and transfers data to and from a register in the custom module. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LinePitch** Total number of bytes between 2 successive lines. This feature is used to facilitate alignment of image data. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ChunkLvFrameAbort** Flag indicating if a frame was dropped when acquiring the image included in the payload. [LvFtrType_Boolean](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ChunkLvTriggerDropped** Flag indicating if a trigger was dropped when acquiring the image included in the payload. [LvFtrType_Boolean](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ChunkLvTriggerError** Flag indicating if a mismatch between trigger and sensor data was detected when acquiring the image included in the payload. [LvFtrType_Boolean](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).

- LvDevice_ChunkLvEncoderPosition** Encoder position generating the trigger for the image included in the payload. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_ChunkLvEncoderRotation** Encoder rotation generating the trigger for the image included in the payload. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_RegionNumber** Defines the number of regions (Sequence of exposures). [LvFtrType_Enumeration](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_UserSetDefault** Selects the default feature configuration set to be loaded and activated upon camera boot or reset. [LvFtrType_Enumeration](#). Values: [LvUserSetDefault](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvLineDebounceMode** Sets the mode of the line debounce filter. [LvFtrType_Enumeration](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_Gamma** Sets the gamma value. [LvFtrType_Float](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvCustomReg1** Transfers data to and from a register in the custom module. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvCustomReg2** Transfers data to and from a register in the custom module. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvCustomReg3** Transfers data to and from a register in the custom module. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvCustomReg4** Transfers data to and from a register in the custom module. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvCustomReg5** Transfers data to and from a register in the custom module. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvCustomReg6** Transfers data to and from a register in the custom module. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvCustomReg7** Transfers data to and from a register in the custom module. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvCustomReg8** Transfers data to and from a register in the custom module. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvCustomReg9** Transfers data to and from a register in the custom module. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvCustomReg10** Transfers data to and from a register in the custom module. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvCustomReg11** Transfers data to and from a register in the custom module. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvCustomReg12** Transfers data to and from a register in the custom module. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvCustomReg13** Transfers data to and from a register in the custom module. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvCustomReg14** Transfers data to and from a register in the custom module. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvCustomReg15** Transfers data to and from a register in the custom module. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvCustomReg16** Transfers data to and from a register in the custom module. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvCustomBypass** Bypass the custom module. [LvFtrType_Integer](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvDeviceTemperatureMax** max temperature at the selected location in degrees of Celcius [LvFtrType_Float](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).
- LvDevice_LvDeviceTemperatureMin** min temperature at the selected location in degrees of Celcius [LvFtrType_Float](#). Device remote feature ([LvFtrGroup_DeviceRemote](#)).

- LvDevice_DeviceID** Device ID. [LvFtrType_String](#). Device GenTL feature ([LvFtrGroup_DeviceGtl](#)).
- LvDevice_DeviceType** Device type. [LvFtrType_Enumeration](#). Values: [LvDeviceType](#). Device GenTL feature ([LvFtrGroup_DeviceGtl](#)).
- LvDevice_GevDeviceIPAddress** Device IP address. [LvFtrType_Integer](#). Device GenTL feature ([LvFtrGroup_DeviceGtl](#)).
- LvDevice_GevDeviceSubnetMask** Device subnet mask. [LvFtrType_Integer](#). Device GenTL feature ([LvFtrGroup_DeviceGtl](#)).
- LvDevice_GevDeviceMACAddress** Device MAC address. [LvFtrType_Integer](#). Device GenTL feature ([LvFtrGroup_DeviceGtl](#)).
- LvDevice_GevDeviceGateway** Device gateway. [LvFtrType_Integer](#). Device GenTL feature ([LvFtrGroup_DeviceGtl](#)).
- LvDevice_LvGevDeviceStreamCaptureMode** Device stream capture mode. Controls, how the GVSP (image) stream is processed by the host machine. [LvFtrType_Enumeration](#). Values: [LvGevDeviceStreamCaptureMode](#). Device GenTL feature ([LvFtrGroup_DeviceGtl](#)).
- LvDevice_StreamSelector** Stream selector. [LvFtrType_Integer](#). Device GenTL feature ([LvFtrGroup_DeviceGtl](#)).
- LvDevice_StreamID** Stream ID. [LvFtrType_String](#). Device GenTL feature ([LvFtrGroup_DeviceGtl](#)).
- LvDevice_DeviceEndiannessMechanism** Identifies the endianness mode. This feature should be set to 'standard' for all GigE Vision remote devices based on GenICam schema version 1.1 (and newer). The value 'legacy' is intended for devices using GenICam schema version 1.0. Values: [LvDeviceEndiannessMechanism](#). [LvFtrType_Enumeration](#). Device GenTL feature ([LvFtrGroup_DeviceGtl](#)).
- LvDevice_LvGevFindMaxPacketSize** Determine the maximal usable packet size for streaming. The procedure is already applied automatically when opening the device. Do not use during active streaming. [LvFtrType_Command](#). Device GenTL feature ([LvFtrGroup_DeviceGtl](#)).
- LvDevice_LvGevPacketSizeValue** Streaming packet size to be verified using the Test Packet Size command. Do not use during active streaming. [LvFtrType_Integer](#). Device GenTL feature ([LvFtrGroup_DeviceGtl](#)).
- LvDevice_LvGevTestPacketSize** Test if the selected packet size is suitable for streaming in current network configuration. [LvFtrType_Command](#). Device GenTL feature ([LvFtrGroup_DeviceGtl](#)).
- LvDevice_LvGevPacketSizeTestSuccess** Reports success of the last packet size test command. [LvFtrType_Boolean](#). Device GenTL feature ([LvFtrGroup_DeviceGtl](#)).
- LvDevice_LvGevCCTT** Controls the GigE Vision control channel transmission timeout value in milliseconds. When it expires, the acknowledge from the device will be considered as missing and the command eventually sent again. [LvFtrType_Command](#). Device GenTL feature ([LvFtrGroup_DeviceGtl](#)).
- LvDevice_LvGevCCRC** Controls the number of GigE Vision control channel command retransmissions allowed when a control channel command times out. [LvFtrType_Command](#). Device GenTL feature ([LvFtrGroup_DeviceGtl](#)).
- LvDevice_LvCCStatus** Control channel status. [LvFtrType_Integer](#). Device GenTL feature ([LvFtrGroup_DeviceGtl](#)).
- LvDevice_DeviceAccessStatus** Device access status. [LvFtrType_Integer](#). Device GenTL feature ([LvFtrGroup_DeviceGtl](#)).
- LvDevice_LvCCLinkStatus** Control channel link status. [LvFtrType_Enumeration](#). Values: [LvCCLinkStatus](#). Device GenTL feature ([LvFtrGroup_DeviceGtl](#)).
- LvDevice_LvDeviceDisplayName** User readable name of the device. [LvFtrType_String](#). Device local feature ([LvFtrGroup_DeviceLocal](#)).
- LvDevice_LvDevicesAcquiring** Returns true if the acquisition was started. Note that this feature does not tell whether the images are actually delivered to the output buffer queue; it simply informs that your application is between the AcquisitionStart and AcquisitionStop actions. [LvFtrType_Boolean](#). Device local feature ([LvFtrGroup_DeviceLocal](#)).
- LvDevice_LvUniProcessMode** The UniProcessing provides unified API for image preprocessing, which is done either on the device itself, if it is supported by the hardware, or by software, if not. The preprocessing includes Bayer decoding or pixel format conversion, application of LUT and Color Correction. [LvFtrType_Enumeration](#). Values: [LvUniProcessMode](#). Device local feature ([LvFtrGroup_DeviceLocal](#)).

LvDevice_LvUniProcessEnableInPlace If possible, the software image preprocessing will be preferably done in the same image (not to another buffer). This is possible only in case the preprocessing does not change the pixel format, that means the `LvUniPixelFormat` must be equal to `PixelFormat` (for example the Bayer decoding is not done by software). `LvFtrType_Boolean`. Device local feature (`LvFtrGroup_↔DeviceLocal`).

LvDevice_LvUniPixelFormat If the image preprocessing is enabled, this is the desired pixel format, to which the image is to be converted. Only monochrome and RGB/BGR color pixel formats are supported. The processing chain is set so that:

- if the `PixelFormat` is undecoded Bayer, the Bayer decoding to desired `LvUniPixelFormat` is included
- otherwise if the `PixelFormat` is not equal to `LvUniPixelFormat`, a pixel format conversion is included. `LvFtrType_Enumeration`. Values: see `LvPixelFormat`. Device local feature (`LvFtrGroup_Device↔Local`).

LvDevice_LvUniProcessPayloadSize Returns the size needed for the processing output buffer, which is to be used when the in-place processing is not enabled or not possible. Normally is this buffer allocated automatically for each acquisition buffer, but your application can also provide your own buffers and this feature gives the size of the buffers needed. `LvFtrType_Integer`. Device local feature (`LvFtrGroup_↔DeviceLocal`).

LvDevice_LvUniLinePitch The line increment of the process buffer, if the processing is active, or of the source buffer, if processing is not active. To access the image regardless whether it was processed to the process buffer or not, you need 5 independent values:

- Pointer to the data - use `LvUniBase` feature of the Buffer, which points either to the acquired image (if no processing was done), or to the processed image (if it was processed).
- Width and height - these are the same for the acquired and processed image, so use the `Width` and `Height` from the remote device, or `ChunkWidth` and `ChunkHeight` if these can change during the acquisition.
- Pixel format - use `LvUniPixelFormat` - if this is different from the `PixelFormat` then processing is done, so `LvUniPixelFormat` is always correct.
- Line pitch - use `LvUniLinePitch`, which returns proper line pitch of the buffer, to which the `LvUniBase` pointer points. Note that the above is valid only in case the processing can be successfully done (for example the source image is not in unsupported `PixelFormat`) and is not disabled (for example by `LvUniProcessExecution=OnExplicitRequest`). `LvFtrType_Integer`. Device local feature (`LvFtr↔Group_DeviceLocal`).

LvDevice_LvUniBayerDecoderAlgorithm Selects the Bayer array decoding method for the software processing. This does not apply to the hardware Bayer decoding on the device, which is usually fixed to one method. `LvFtrType_Enumeration`. Values: `LvBayerDecoderAlgorithm`. Device local feature (`LvFtr↔Group_DeviceLocal`).

LvDevice_LvUniBrightness Brightness of the image. It is realized by the LUT. Values under 1.0 means darker than original, above 1.0 lighter than the original. The `LvUniLUTMode` must be `Generated`, in order to enable this feature. `LvFtrType_Float`. Device local feature (`LvFtrGroup_DeviceLocal`).

LvDevice_LvUniContrast Contrast of the image. It is realized by the LUT. Values under 1.0 means lower contrast than original, above 1.0 higher contrast than the original. The `LvUniLUTMode` must be `Generated`, in order to enable this feature. `LvFtrType_Float`. Device local feature (`LvFtrGroup_DeviceLocal`).

LvDevice_LvUniGamma Gamma correction of the image. It is realized by the LUT. Values under 1.0 make the middle tones darker, above 1.0 lighter. The `LvUniLUTMode` must be `Generated`, in order to enable this feature. `LvFtrType_Float`. Device local feature (`LvFtrGroup_DeviceLocal`).

LvDevice_LvUniBalanceRatioSelector Selects which color channel will be accessed by the `LvUniBalance↔Ratio` feature. The `LvUniLUTMode` must be `Generated`, in order to enable this feature. `LvFtrType_↔Enumeration`. Values: `LvUniBalanceRatioSelector`. Device local feature (`LvFtrGroup_DeviceLocal`).

LvDevice_LvUniBalanceRatio The white balance factor to be applied on the selected color channel. The selected color channel of all pixels will be multiplied by this value (not directly, but through the precalculated LUT). If the value is < 1.0 , the saturated pixels will become gray (white is no more white). Thus it is better if all 3 factors are greater than or equal to 1.0. `LvFtrType_Float`. Device local feature (`LvFtrGroup_↔DeviceLocal`).

- LvDevice_LvUniBalanceWhiteAuto** Selects the action for automatic white balance calculation. Currently only the option Once is available. Setting this option causes the following:
- if there is already acquired image available, the white balance factors are calculated from this image and LUT is updated to reflect the changes
 - if there is no image acquired yet, an internal flag is set and the calculation is done when the image is acquired. Note that the enumeration is self-clearing, that means its value is automatically changed to Off, when the white balance calculation is finished. The newly calculated white balance is applied to newly acquired images, not to the existing ones, unless you explicitly call the ExecProcess command for the already acquired buffers. At the time of calculation the camera should look at a neutral grey (not white) object, which should fill the whole image area. Making white balance from normal image can bring less satisfactory results. [LvFtrType_Enumeration](#). Values: [LvUniBalanceWhiteAuto](#). Device local feature ([LvFtrGroup_DeviceLocal](#)).
- LvDevice_LvUniBalanceWhiteReset** Sets all the white balance factors ([LvUniBalanceRatio](#)) to 1. The advantage of this feature in comparison with setting the 3 factors to 1 is that the LUT is updated only once, so it is faster. [LvFtrType_Command](#). Device local feature ([LvFtrGroup_DeviceLocal](#)).
- LvDevice_LvUniColorTransformationSelector** Selects which color transformation module is controlled by the color transformation features. It also gives particular meaning to individual color transformation gains. [LvFtrType_Enumeration](#). Values: [LvUniColorTransformationSelector](#). Device local feature ([LvFtrGroup_DeviceLocal](#)).
- LvDevice_LvUniColorTransformationEnable** Enables the Color Transformation in the processing. When disabled, the Color Transformation matrix does not lose its values; when enabling it, the original values are retained. [LvFtrType_Boolean](#). Device local feature ([LvFtrGroup_DeviceLocal](#)).
- LvDevice_LvUniColorTransformationValueSelector** Selects the cell of the Color Transformation matrix to be accessed by [LvUniColorTransformationValue](#). [LvFtrType_Enumeration](#). Values: [LvColorTransformationValueSelector](#). Device local feature ([LvFtrGroup_DeviceLocal](#)).
- LvDevice_LvUniColorTransformationValue** The value of the selected cell of the Color Transformation matrix. [LvFtrType_Float](#). Device local feature ([LvFtrGroup_DeviceLocal](#)).
- LvDevice_LvUniSaturation** Sets the Color Correction matrix according to specified saturation. The saturation set to 0 causes a conversion to greyscale, 1.0 leaves the image identical, 2.0 emphasizes the colors. [LvFtrType_Float](#). Device local feature ([LvFtrGroup_DeviceLocal](#)).
- LvDevice_LvUniProcessExecution** Defines the point, when the software image processing of the buffer is done. You may need to define this point in case you do not need all the images to be processed. Note that this applies only to the software processing; the hardware processing is done on the remote device always. [LvFtrType_Enumeration](#). Values: [LvUniProcessExecution](#). Device local feature ([LvFtrGroup_DeviceLocal](#)).
- LvDevice_LvUniLUTMode** Selects the LUT control mode. The mode determines, if the LUT can be directly modified by the application, or if the LUT is to be reserved for implementation of white balance, gamma, brightness and contrast - in such case the LUT is filled with precalculated values by SynView library and cannot be directly modified. [LvFtrType_Enumeration](#). Values: [LvUniLUTMode](#). Device local feature ([LvFtrGroup_DeviceLocal](#)).
- LvDevice_LvUniLUTSelector** This selector selects for which LUT is applied [LvUniLUTIndex](#)/[LvUniLUTValue](#). In case of monochrome image the LUT has only one array = Luminance. In case of color images, the LUT consists of 3 arrays, for Red, Green and Blue. [LvFtrType_Enumeration](#). Values: [LvUniLUTSelector](#). Device local feature ([LvFtrGroup_DeviceLocal](#)).
- LvDevice_LvUniLUTEnable** Enables the LUT in the processing. When disabled, the LUT does not lose its values, the disabled LUT is substituted by a linear LUT, and when enabling the LUT, the original values are retained. [LvFtrType_Boolean](#). Device local feature ([LvFtrGroup_DeviceLocal](#)).
- LvDevice_LvUniLUTIndex** Index of the element to be accessed in the selected LUT via the [LvUniLUTValue](#) feature. Note that accessing the whole LUT by this approach can be very time consuming, namely on GigE cameras. If possible, it is better to use the [LvUniLUTValueAll](#) or SynView dedicated LUT functions. [LvFtrType_Integer](#). Device local feature ([LvFtrGroup_DeviceLocal](#)).
- LvDevice_LvUniLUTValue** Value of the element for the current [LvUniLUTIndex](#) in the selected LUT. Note that accessing the whole LUT by this approach can be very time consuming, namely on GigE cameras. If possible, it is better to use the [LvUniLUTValueAll](#) or SynView dedicated LUT functions. [LvFtrType_Integer](#). Device local feature ([LvFtrGroup_DeviceLocal](#)).

LvDevice_LvUniLUTValueAll This feature enables to get/set the entire content of the selected LUT in one block access. Beware that the LUT buffer structure is vendor and model dependent, so take care if your application is expected to work with various types of devices or devices from various vendors. [LvFtrType_Buffer](#). Device local feature ([LvFtrGroup_DeviceLocal](#)).

LvDevice_LvUniColorTransformationMode Selects the Color Transformation matrix control mode. The mode determines, if the matrix can be directly modified by the application, or if the matrix is to be reserved for implementation of the Saturation or other higher level features - in such case the matrix is filled with precalculated values by SynView library and cannot be directly modified. [LvFtrType_Enumeration](#). Values: [LvUniColorTransformationMode](#). Device local feature ([LvFtrGroup_DeviceLocal](#)).

LvDevice_LvDeviceExpiringDate expiring date of the device. [LvFtrType_String](#). Device local feature ([LvFtrGroup_DeviceLocal](#)).

LvDevice_LvDeviceRegistersStreamingStart Prepare the device for registers streaming without checking for consistency. [LvFtrType_Command](#). Device local feature ([LvFtrGroup_DeviceLocal](#)).

LvDevice_LvDeviceRegistersStreamingEnd Announce the end of registers streaming. This will do a register set validation for consistency and activate it. [LvFtrType_Command](#). Device local feature ([LvFtrGroup_DeviceLocal](#)).

LvDevice_LvUniLUTReset Resets to linear LUT. [LvFtrType_Command](#). Device local feature ([LvFtrGroup_DeviceLocal](#)).

LvDevice_Info Constant to be used in [LvGetInfo\(\)](#) and [LvGetInfoStr\(\)](#) to obtain various info about the device.

Definition at line 718 of file sv.synview.enums.h.

5.29.2.3 enum LvEventFtr

LvEventFtr constants.

Enumerator

LvEvent_EventType Represents the GenTL EVENT_EVENT_TYPE info - The event type. [LvFtrType_Integer](#).

LvEvent_NumInQueue Represents the GenTL EVENT_NUM_IN_QUEUE info - Number of events in the event data queue. [LvFtrType_Integer](#).

LvEvent_NumFired Represents the GenTL EVENT_NUM_FIRED info - Number of events, that were fired since the creation of the event. [LvFtrType_Integer](#)

Definition at line 3443 of file sv.synview.enums.h.

5.29.2.4 enum LvInterfaceFtr

LvInterfaceFtr constants.

Enumerator

LvInterface_InterfaceID Interface ID. [LvFtrType_String](#). Interface GenTL feature ([LvFtrGroup_InterfaceGtl](#)).

LvInterface_InterfaceType Interface type. [LvFtrType_Enumeration](#). Values: [LvInterfaceType](#). Interface GenTL feature ([LvFtrGroup_InterfaceGtl](#)).

LvInterface_GevInterfaceGatewaySelector Interface gateway selector. [LvFtrType_Integer](#). Interface GenTL feature ([LvFtrGroup_InterfaceGtl](#)).

LvInterface_GevInterfaceGateway Interface gateway. [LvFtrType_Integer](#). Depends on [LvInterface_GevInterfaceGatewaySelector](#). Interface GenTL feature ([LvFtrGroup_InterfaceGtl](#)).

LvInterface_GevInterfaceMACAddress Interface MAC address. [LvFtrType_Integer](#). Interface GenTL feature ([LvFtrGroup_InterfaceGtl](#)).

LvInterface_GevInterfaceSubnetSelector Interface subnet selector. [LvFtrType_Integer](#). Interface GenTL feature ([LvFtrGroup_InterfaceGtl](#)).

- LvInterface_GevInterfaceSubnetIPAddress** Interface subnet IP address. [LvFtrType_Integer](#). Depends on [LvInterface_GevInterfaceSubnetSelector](#). Interface GenTL feature ([LvFtrGroup_InterfaceGtl](#)).
- LvInterface_GevInterfaceSubnetMask** Interface subnet mask. [LvFtrType_Integer](#). Interface GenTL feature ([LvFtrGroup_InterfaceGtl](#)).
- LvInterface_DeviceUpdateList** Update internal list of devices. [LvFtrType_Command](#). Interface GenTL feature ([LvFtrGroup_InterfaceGtl](#)).
- LvInterface_DeviceSelector** Device selector. [LvFtrType_Integer](#). Interface GenTL feature ([LvFtrGroup_InterfaceGtl](#)).
- LvInterface_DeviceID** Device ID. [LvFtrType_String](#). Depends on [LvInterface_DeviceSelector](#). Interface GenTL feature ([LvFtrGroup_InterfaceGtl](#)).
- LvInterface_DeviceVendorName** Device vendor name. [LvFtrType_String](#). Depends on [LvInterface_DeviceSelector](#). Interface GenTL feature ([LvFtrGroup_InterfaceGtl](#)).
- LvInterface_DeviceModelName** Device Model name. [LvFtrType_String](#). Depends on [LvInterface_DeviceSelector](#). Interface GenTL feature ([LvFtrGroup_InterfaceGtl](#)).
- LvInterface_DeviceAccessStatus** Device access status. [LvFtrType_Enumeration](#). Values: [LvDeviceAccessStatus](#). Depends on [LvInterface_DeviceSelector](#). Interface GenTL feature ([LvFtrGroup_InterfaceGtl](#)).
- LvInterface_GevDeviceIPAddress** Device IP address. [LvFtrType_Integer](#). Depends on [LvInterface_DeviceSelector](#). Interface GenTL feature ([LvFtrGroup_InterfaceGtl](#)).
- LvInterface_GevDeviceSubnetMask** Device subnet mask. [LvFtrType_Integer](#). Depends on [LvInterface_DeviceSelector](#). Interface GenTL feature ([LvFtrGroup_InterfaceGtl](#)).
- LvInterface_GevDeviceMACAddress** Device MAC address. [LvFtrType_Integer](#). Depends on [LvInterface_DeviceSelector](#). Interface GenTL feature ([LvFtrGroup_InterfaceGtl](#)).
- LvInterface_DeviceUserID** Device User ID. [LvFtrType_String](#). Depends on [LvInterface_DeviceSelector](#). Interface GenTL feature ([LvFtrGroup_InterfaceGtl](#)).
- LvInterface_DeviceSerialNumber** Device identifier (serial number). [LvFtrType_String](#). Depends on [LvInterface_DeviceSelector](#). Interface GenTL feature ([LvFtrGroup_InterfaceGtl](#)).
- LvInterface_InterfaceTLVersionMajor** Interface TL version major. [LvFtrType_Integer](#). Interface GenTL feature ([LvFtrGroup_InterfaceGtl](#)).
- LvInterface_InterfaceTLVersionMinor** Interface TL version minor. [LvFtrType_Integer](#). Interface GenTL feature ([LvFtrGroup_InterfaceGtl](#)).
- LvInterface_DeviceTLVersionMajor** Device TL version major. [LvFtrType_Integer](#). Depends on [LvInterface_DeviceSelector](#). Interface GenTL feature ([LvFtrGroup_InterfaceGtl](#)).
- LvInterface_DeviceTLVersionMinor** Device TL version minor. [LvFtrType_Integer](#). Depends on [LvInterface_DeviceSelector](#). Interface GenTL feature ([LvFtrGroup_InterfaceGtl](#)).
- LvInterface_InterfaceDisplayName** User readable name of the interface. [LvFtrType_String](#). Interface local feature ([LvFtrGroup_InterfaceLocal](#)).
- LvInterface_Info** Constant to be used in [LvGetInfo\(\)](#) and [LvGetInfoStr\(\)](#) to obtain various info about the interface.

Definition at line 583 of file `sv.synview.enums.h`.

5.29.2.5 enum LvRendererFtr

LvRendererFtr constants.

Enumerator

- LvRenderer_LvAutoDisplay** If set, the image is automatically displayed before it is passed to the supplied callback. This is functional only in case the Event thread is started. [LvFtrType_Boolean](#). Renderer local feature ([LvFtrGroup_RendererLocal](#)).

- LvRenderer_LvRenderType** Controls way how the acquired images are rendered on the screen. Note that all the Scale- options require scaling capability of the display and might not be supported in all operating systems. [LvFtrType_Enumeration](#). Values: [LvRenderType](#). [Renderer local feature \(LvFtrGroup_↔RendererLocal\)](#).
- LvRenderer_LvOffsetX** Sets the horizontal offset of the image to be rendered, i.e. the distance from the left edge of the display window. [LvFtrType_Integer](#). [Renderer local feature \(LvFtrGroup_RendererLocal\)](#).
- LvRenderer_LvOffsetY** Sets the vertical offset of the image to be rendered, i.e. the distance from the top edge of the display window. [LvFtrType_Integer](#). [Renderer local feature \(LvFtrGroup_RendererLocal\)](#).
- LvRenderer_LvWidth** Sets the width of the rectangle to which the image is to be rendered. Note that if the [LvIgnoreAspectRatio](#) feature is False, the real image width can be smaller, in order to keep the aspect ratio. [LvFtrType_Integer](#). [Renderer local feature \(LvFtrGroup_RendererLocal\)](#).
- LvRenderer_LvHeight** Sets the height of the rectangle to which the image is to be rendered. Note that if the [LvIgnoreAspectRatio](#) feature is False, the real image height can be smaller, in order to keep the aspect ratio. [LvFtrType_Integer](#). [Renderer local feature \(LvFtrGroup_RendererLocal\)](#).
- LvRenderer_LvIgnoreAspectRatio** Allows to ignore the original aspect ratio while rendering the image, so the image can be scaled up/down in one dimension with different factor than in the other dimension. [LvFtrType_Boolean](#). [Renderer local feature \(LvFtrGroup_RendererLocal\)](#).
- LvRenderer_LvDisableScaleUp** Disables scaling the image up. [LvFtrType_Boolean](#). [Renderer local feature \(LvFtrGroup_RendererLocal\)](#).
- LvRenderer_LvDisableScaleDown** Disables scaling the image down. [LvFtrType_Boolean](#). [Renderer local feature \(LvFtrGroup_RendererLocal\)](#).
- LvRenderer_LvCenterImage** If the image is smaller than required window client size or the specified rectangle, the image is placed to the center. [LvFtrType_Boolean](#). [Renderer local feature \(LvFtrGroup_↔RendererLocal\)](#).
- LvRenderer_LvNumberOfTiles** Sets the number of tiles used for image rendering. Note that for the tile repaint is needed that the corresponding buffers are still in the application ownership; once the buffer is placed to the input buffer pool, it should not be accessed for paint anymore (see also [LvPostponeQueue↔Buffers](#)). [LvFtrType_Integer](#). [Renderer local feature \(LvFtrGroup_RendererLocal\)](#).
- LvRenderer_LvColumns** Sets the number of columns used for image rendering. When the value is 0, the number of columns is calculated automatically. [LvFtrType_Integer](#). [Renderer local feature \(LvFtrGroup_↔RendererLocal\)](#).
- LvRenderer_LvRows** Sets the number of rows used for image rendering. When the value is 0, the number of rows is calculated automatically. [LvFtrType_Integer](#). [Renderer local feature \(LvFtrGroup_RendererLocal\)](#).
- LvRenderer_LvTileGap** Sets the gap between the tiles in pixels. [LvFtrType_Integer](#). [Renderer local feature \(LvFtrGroup_RendererLocal\)](#).
- LvRenderer_LvAutoTileCalculation** When set to True, the tile sizes and positions are calculated automatically. When the [LvColumns](#) and/or [LvRows](#) are 0, also the number of columns and/or rows is calculated automatically. [LvFtrType_Boolean](#). [Renderer local feature \(LvFtrGroup_RendererLocal\)](#).
- LvRenderer_LvShowPixel** Activate the Pixel Coordinate section for getting pixel values at given coordinates. [LvFtrType_Boolean](#). [Renderer local feature \(LvFtrGroup_RendererLocal\)](#).
- LvRenderer_LvPixelCoordinateX** Sets the horizontal coordinate of the pixel for which the value should be retrieved. [LvFtrType_Integer](#). [Renderer local feature \(LvFtrGroup_RendererLocal\)](#).
- LvRenderer_LvPixelCoordinateY** Sets the vertical coordinate of the pixel for which the value should be retrieved. [LvFtrType_Integer](#). [Renderer local feature \(LvFtrGroup_RendererLocal\)](#).
- LvRenderer_LvPixelVal1** First Value of the retrieved Pixel. [LvFtrType_Integer](#). [Renderer local feature \(Lv↔FtrGroup_RendererLocal\)](#).
- LvRenderer_LvPixelVal2** Second Value of the retrieved Pixel. [LvFtrType_Integer](#). [Renderer local feature \(LvFtrGroup_RendererLocal\)](#).
- LvRenderer_LvPixelVal3** Third Value of the retrieved Pixel. [LvFtrType_Integer](#). [Renderer local feature \(Lv↔FtrGroup_RendererLocal\)](#).
- LvRenderer_LvShowCrossHair** Activate a cross hair function [Renderer local feature \(LvFtrGroup_↔RendererLocal\)](#).

LvRenderer_LvShowHistogram Activate a histogram window. [LvFtrType_Boolean](#). Renderer local feature ([LvFtrGroup_RendererLocal](#)).

LvRenderer_Info Constant to be used in [LvGetInfo\(\)](#) and [LvGetInfoStr\(\)](#) to obtain various info about the device.

Definition at line 3287 of file sv.synview.enums.h.

5.29.2.6 enum LvStreamFtr

LvStreamFtr constants.

Enumerator

LvStream_StreamID Stream ID. [LvFtrType_String](#). Stream GenTL feature ([LvFtrGroup_StreamGtl](#)).

LvStream_StreamAnnouncedBufferCount Number of buffers announced for the data stream. [LvFtrType_Integer](#). Stream GenTL feature ([LvFtrGroup_StreamGtl](#)).

LvStream_StreamAcquisitionModeSelector Selects desired acquisition mode. [LvFtrType_Enumeration](#). Values: [LvStreamAcquisitionModeSelector](#). Stream GenTL feature ([LvFtrGroup_StreamGtl](#)).

LvStream_StreamAnnounceBufferMinimum Minimum number of buffers to be announced for selected acquisition mode. [LvFtrType_Integer](#). Stream GenTL feature ([LvFtrGroup_StreamGtl](#)).

LvStream_StreamType Stream type. [LvFtrType_Enumeration](#). Values: [LvStreamType](#). Stream GenTL feature ([LvFtrGroup_StreamGtl](#)).

LvStream_LvStreamDisplayName Returns the display name of the stream. [LvFtrType_String](#). Stream local feature ([LvFtrGroup_StreamLocal](#)).

LvStream_LvCalcPayloadSize Returns the payload size (size of buffer to hold the image data). If the payload size is not provided by the stream or device, it is calculated, so this feature returns always a valid value. [LvFtrType_Integer](#). Stream local feature ([LvFtrGroup_StreamLocal](#)).

LvStream_LvPostponeQueueBuffers Number of buffers to be kept postponed before returning to the input buffer pool. [LvFtrType_Integer](#). Stream local feature ([LvFtrGroup_StreamLocal](#)).

LvStream_LvAwaitDeliveryLimit Limit for images in the output buffer. Applicable only if the event thread is running - then if there is more than this number of buffers in the output queue, the oldest buffers are discarded and returned to input buffer pool. This is useful in case the application is not able to process all the images in time. [LvFtrType_Integer](#). If the value is 0, this limit is inactive. Stream local feature ([LvFtrGroup_StreamLocal](#)).

LvStream_LvAutoAllocateProcessBuffers Enable the auto allocation of process buffers. The process buffers are allocated only if they are needed for the image processing or conversion. You can disable the automatic buffer allocation and provide own buffers, using the [LvBufferAttachProcessBuffer\(\)](#) function. [LvFtrType_Boolean](#). Stream local feature ([LvFtrGroup_StreamLocal](#)).

LvStream_LvPreallocateProcessBuffers Preallocates all the process buffers, even if it is not yet sure if they will be needed. With this command you can avoid time delays when allocating the buffers during the acquisition. [LvFtrType_Command](#). Stream local feature ([LvFtrGroup_StreamLocal](#)).

LvStream_LvNumDelivered Number of acquired frames since last acquisition start. It is equivalent to the GenTL STREAM_INFO_NUM_DELIVERED info. [LvFtrType_Integer](#). Stream local feature ([LvFtrGroup_StreamLocal](#)).

LvStream_LvNumUnderrun Number of lost frames due to input buffer pool underrun since stream open. It is equivalent to the GenTL STREAM_INFO_NUM_UNDERRUN info. [LvFtrType_Integer](#). Stream local feature ([LvFtrGroup_StreamLocal](#)).

LvStream_LvNumAnnounced Number of announced buffers. It is equivalent to the GenTL STREAM_INFO_NUM_ANNOUNCED info. [LvFtrType_Integer](#). Stream local feature ([LvFtrGroup_StreamLocal](#)).

LvStream_LvNumQueued Number of buffers currently in the input pool. It is equivalent to the GenTL STREAM_INFO_NUM_QUEUED info. [LvFtrType_Integer](#). Stream local feature ([LvFtrGroup_StreamLocal](#)).

LvStream_LvNumAwaitDelivery Number of buffers currently in the output queue. It is equivalent to the GenTL STREAM_INFO_NUM_AWAIT_DELIVERY info. [LvFtrType_Integer](#). Stream local feature ([LvFtrGroup_StreamLocal](#)).

LvStream_LvIsGrabbing Flag indicating whether the acquisition engine is started or not. This is independent from the acquisition status of the remote device. It is equivalent to the GenTL STREAM_INFO_IS_GRABBING info. [LvFtrType_Boolean](#). Stream local feature ([LvFtrGroup_StreamLocal](#)).

LvStream_LvNumAborted Number of aborted frames since last acquisition start. [LvFtrType_Integer](#). Stream local feature ([LvFtrGroup_StreamLocal](#)).

LvStream_LvNumStarted Number of started frames since stream open. It is equivalent to the GenTL STREAM_INFO_NUM_STARTED info. [LvFtrType_Integer](#). Stream local feature ([LvFtrGroup_StreamLocal](#)).

LvStream_Info Constant to be used in [LvGetInfo\(\)](#) and [LvGetInfoStr\(\)](#) to obtain various info about the stream.

- enum `LvUniLUTSelector` { `LvUniLUTSelector_Luminance`, `LvUniLUTSelector_Red`, `LvUniLUTSelector_Green`, `LvUniLUTSelector_Blue` }
- enum `LvUniColorTransformationMode` { `LvUniColorTransformationMode_Direct`, `LvUniColorTransformationMode_Generated` }
- enum `LvStrobeEnable` { `LvStrobeEnable_Off`, `LvStrobeEnable_AllClusters`, `LvStrobeEnable_LEDCluster1`, `LvStrobeEnable_LEDCluster2` }
- enum `LvStrobeDurationMode` { `LvStrobeDurationMode_FrameRateRelated`, `LvStrobeDurationMode_Free` }
- enum `LvStrobeDropMode` { `LvStrobeDropMode_DropStrobe`, `LvStrobeDropMode_DelayFrame` }
- enum `LvRegionSelector` { `LvRegionSelector_Region0`, `LvRegionSelector_Region1`, `LvRegionSelector_Region2`, `LvRegionSelector_Region3` }

5.30.1 Detailed Description

5.30.2 Enumeration Type Documentation

5.30.2.1 enum `LvAcquisitionFrameRateControlMode`

Enum values for the `LvDevice_LvAcquisitionFrameRateControlMode` feature.

Enumerator

`LvAcquisitionFrameRateControlMode_Off` Disables frame rate control - the camera operates at maximum frame rate

`LvAcquisitionFrameRateControlMode_On` Enables frame rate control - the rate can be explicitly adjusted

Definition at line 4432 of file `sv.synview.enums.h`.

5.30.2.2 enum LvAcquisitionMode

Enum values for the [LvDevice_AcquisitionMode](#) feature.

Enumerator

LvAcquisitionMode_SingleFrame Single frame acquisition - after acquisition starts, single frame is acquired and acquisition stops.

LvAcquisitionMode_MultiFrame Multiple frame acquisition - after acquisition starts, specified number of frames is acquired and acquisition stops.

LvAcquisitionMode_Continuous Continuous acquisition - after starting, the acquisition is active until explicitly stopped.

Definition at line 4169 of file sv.synview.enums.h.

5.30.2.3 enum LvAOIMode

Enum values for the [LvDevice_LvAOIMode](#) feature.

Enumerator

LvAOIMode_Automatic Camera automatically applies as much of the desired AOI setting on the sensor and the rest is cut on transfer

LvAOIMode_ClipOnTransfer The AOI is applied before the transfer, in camera memory

LvAOIMode_Manual Fine control of separate AOI setting on the sensor and before the transfer

Definition at line 4151 of file sv.synview.enums.h.

5.30.2.4 enum LvBalanceRatioSelector

Enum values for the [LvDevice_BalanceRatioSelector](#) feature.

Enumerator

LvBalanceRatioSelector_Red Balance ratio will be applied to the red channel.

LvBalanceRatioSelector_Green Balance ratio will be applied to the green channel.

LvBalanceRatioSelector_Blue Balance ratio will be applied to the blue channel.

Definition at line 6307 of file sv.synview.enums.h.

5.30.2.5 enum LvBalanceWhiteAuto

Enum values for the [LvDevice_BalanceWhiteAuto](#) feature.

Enumerator

LvBalanceWhiteAuto_Off Automatic white balance mode off - the automatic white balance is not applied.

LvBalanceWhiteAuto_Once Automatic white balance mode once - the white balance factors are once adjusted, then switches the enumeration back to the Off value.

LvBalanceWhiteAuto_Continuous Automatic white balance mode continuous - the white balance is continuously auto-adjusted.

Definition at line 6325 of file sv.synview.enums.h.

5.30.2.6 enum `LvBayerDecoderAlgorithm`

Enum values for the `LvDevice_LvBayerDecoderAlgorithm` and `LvDevice_LvUniBayerDecoderAlgorithm` feature.

Enumerator

`LvBayerDecoderAlgorithm_NearestNeighbour` Nearest neighbour algorithm - Fastest decoding, giving the worst results, enables also decoding to a monochrome pixel format.

`LvBayerDecoderAlgorithm_BilinearInterpolation` Bilinear interpolation algorithm - Fast common decoding, enables also decoding to a monochrome pixel format.

`LvBayerDecoderAlgorithm_BilinearColorCorrection` Bilinear color correction algorithm - Decoding with quick enhancements on edges.

`LvBayerDecoderAlgorithm_PixelGrouping` Pixel grouping algorithm - Slower decoding, giving very good results.

`LvBayerDecoderAlgorithm_VariableGradient` Variable gradient algorithm - Slowest decoding, giving the best results.

Definition at line 5878 of file `sv.synview.enums.h`.

5.30.2.7 enum `LvBlackLevelAuto`

Enum values for the `LvDevice_BlackLevelAuto` feature.

Enumerator

`LvBlackLevelAuto_Off` Automatic black level mode off - the black level value is controlled 'manually'.

`LvBlackLevelAuto_Once` Automatic black level mode 'once' - the black level value is calculated and applied once and the feature switches back to 'off' (manual mode).

`LvBlackLevelAuto_Continuous` Continuous automatic black level mode - the automatic black level is applied continuously.

Definition at line 5047 of file `sv.synview.enums.h`.

5.30.2.8 enum `LvBlackLevelSelector`

Enum values for the `LvDevice_BlackLevelSelector` feature.

Enumerator

`LvBlackLevelSelector_All` Apply black level on all channels and taps.

`LvBlackLevelSelector_Tap1` Apply black level on tap1.

`LvBlackLevelSelector_Tap2` Apply black level on tap2.

Definition at line 5029 of file `sv.synview.enums.h`.

5.30.2.9 enum `LvBootSwitch`

Enum values for the `LvDevice_LvBootSwitch` feature.

Enumerator

`LvBootSwitch_PureGEV` Selects the pure GigE Vision mode strictly following the GigE Vision specification

`LvBootSwitch_Legacy` Selects the legacy mode allowing dual operation through GigE Vision or custom protocol.

Definition at line 4941 of file `sv.synview.enums.h`.

5.30.2.10 enum LvCCLinkStatus

Enum values for the [LvDevice_LvCCLinkStatus](#) feature.

Enumerator

LvCCLinkStatus_Unknown Unknown.
LvCCLinkStatus_Open Open.
LvCCLinkStatus_Closed Close.
LvCCLinkStatus_Busy Busy.
LvCCLinkStatus_Connected Connected.
LvCCLinkStatus_ReConnected ReConnected.
LvCCLinkStatus_DisConnected DisConnected.
LvCCLinkStatus_Interrupted Interrupted.
LvCCLinkStatus_Lost Lost.
LvCCLinkStatus_LostControl LostControl.

Definition at line 5750 of file sv.synview.enums.h.

5.30.2.11 enum LvChunkGainSelector

Enum values for the [LvDevice_ChunkGainSelector](#) feature.

Enumerator

LvChunkGainSelector_AnalogAll Analog gain.
LvChunkGainSelector_DigitalAll Digital gain.

Definition at line 5614 of file sv.synview.enums.h.

5.30.2.12 enum LvChunkLvExternalADCSelector

Enum values for the [LvDevice_ChunkLvExternalADCSelector](#) feature.

Enumerator

LvChunkLvExternalADCSelector_ExternalADC1 External ADC 1.
LvChunkLvExternalADCSelector_ExternalADC2 External ADC 2.
LvChunkLvExternalADCSelector_ExternalADC3 External ADC 3.
LvChunkLvExternalADCSelector_ExternalADC4 External ADC 4.

Definition at line 6192 of file sv.synview.enums.h.

5.30.2.13 enum LvChunkSelector

Enum values for the [LvDevice_ChunkSelector](#) feature.

Enumerator

LvChunkSelector_OffsetX Selects the X offset chunk for configuration.
LvChunkSelector_OffsetY Selects the Y offset chunk for configuration.
LvChunkSelector_Width Selects the width chunk for configuration.
LvChunkSelector_Height Selects the height chunk for configuration.

- LvChunkSelector_PixelFormat*** Selects the pixel format chunk for configuration.
- LvChunkSelector_LinePitch*** Selects the line pitch chunk for configuration.
- LvChunkSelector_FrameID*** Selects the frame id chunk for configuration.
- LvChunkSelector_Timestamp*** Selects the time stamp chunk for configuration.
- LvChunkSelector_ExposureTime*** Selects the exposure time chunk for configuration.
- LvChunkSelector_Gain*** Selects the gain chunk for configuration.
- LvChunkSelector_LineStatusAll*** Selects the line status all chunk for configuration.
- LvChunkSelector_BlackLevel*** Selects the black level chunk for configuration.
- LvChunkSelector_LvExternalADCValue*** Selects the external ADC chunk for configuration.
- LvChunkSelector_LvSmartAppString*** Selects the smart application string chunk for configuration.
- LvChunkSelector_LvSmartAppInt*** Selects the smart application signed integer chunk for configuration.
- LvChunkSelector_LvSmartAppUint*** Selects the smart application unsigned integer chunk for configuration.
- LvChunkSelector_LvSmartAppRegister*** Selects the smart application raw register chunk for configuration.
- LvChunkSelector_LvTriggerDelayed*** Selects the trigger delayed chunk for configuration.
- LvChunkSelector_LvStrobeDropped*** Selects the strobe dropped chunk for configuration.
- LvChunkSelector_LvFrameAbort*** Selects the frame abort chunk for configuration.
- LvChunkSelector_LvTriggerDropped*** Selects the trigger dropped chunk for configuration.
- LvChunkSelector_LvTriggerError*** Selects the trigger error chunk for configuration.
- LvChunkSelector_LvEncoderPosition*** Selects the encoder position chunk for configuration.
- LvChunkSelector_LvEncoderRotation*** Selects the encoder rotation chunk for configuration.
- LvChunkSelector_LvVirtFrmTriggerAbort*** Selects the frame trigger abort chunk for configuration.
- LvChunkSelector_LvVirtFrmTriggerDrop*** Selects the frame trigger drop chunk for configuration.
- LvChunkSelector_LvVirtFrmTriggerDelay*** Selects the frame trigger delay chunk for configuration.
- LvChunkSelector_LvVirtFrmFirst*** Selects the first virtual frame chunk for configuration.
- LvChunkSelector_LvVirtFrmLength*** Selects the virtual frame length chunk for configuration.

Definition at line 5518 of file sv.synview.enums.h.

5.30.2.14 enum LvColorTransformationSelector

Enum values for the [LvDevice_ColorTransformationSelector](#) feature.

Enumerator

- LvColorTransformationSelector_RGBtoRGB*** RGB to RGB matrix transformation
- LvColorTransformationSelector_RGBtoYUV*** RGB to YUV matrix transformation

Definition at line 5065 of file sv.synview.enums.h.

5.30.2.15 enum LvColorTransformationValueSelector

Enum values for the [LvDevice_ColorTransformationValueSelector](#) feature.

Enumerator

- LvColorTransformationValueSelector_Gain00*** Selects the gain 00 (RR, red-red) entry of the color transformation matrix.

- LvColorTransformationValueSelector_Gain01*** Selects the gain 01 (RG, red-green) entry of the color transformation matrix.
- LvColorTransformationValueSelector_Gain02*** Selects the gain 02 (RB, red-blue) entry of the color transformation matrix.
- LvColorTransformationValueSelector_Gain10*** Selects the gain 10 (GR, green-red) entry of the color transformation matrix.
- LvColorTransformationValueSelector_Gain11*** Selects the gain 11 (GG, green-green) entry of the color transformation matrix.
- LvColorTransformationValueSelector_Gain12*** Selects the gain 12 (GB, green-blue) entry of the color transformation matrix.
- LvColorTransformationValueSelector_Gain20*** Selects the gain 20 (BR, blue-red) entry of the color transformation matrix.
- LvColorTransformationValueSelector_Gain21*** Selects the gain 21 (BG, blue-green) entry of the color transformation matrix.
- LvColorTransformationValueSelector_Gain22*** Selects the gain 22 (BB, blue-blue) entry of the color transformation matrix.
- LvColorTransformationValueSelector_Offset0*** Selects the offset 0 (red) entry of the color transformation matrix.
- LvColorTransformationValueSelector_Offset1*** Selects the offset 1 (green) entry of the color transformation matrix.
- LvColorTransformationValueSelector_Offset2*** Selects the offset 2 (blue) entry of the color transformation matrix.

Definition at line 5080 of file sv.synview.enums.h.

5.30.2.16 enum LvCounterEventSource

Enum values for the [LvDevice_CounterEventSource](#) feature.

Enumerator

- LvCounterEventSource_Off*** Switches counter event signal off - no signal will be incrementing the counter
- LvCounterEventSource_FrameTrigger*** Switches counter event signal to frame trigger - activation of the frame trigger internal signal (before counting down eventual trigger delay) increments the counter.
- LvCounterEventSource_TimerTick*** Switches counter event signal to timer tick - 1MHz clock increments the counter.
- LvCounterEventSource_Line1*** Switches counter event signal to line 1 (optocoupler input) - active edge of line 1 increments the counter.
- LvCounterEventSource_Line2*** Switches counter event signal to line 2 (optocoupler input) - active edge of line 2 increments the counter.
- LvCounterEventSource_Line3*** Switches counter event signal to line 3 (optocoupler input) - active edge of line 3 increments the counter.
- LvCounterEventSource_Line4*** Switches counter event signal to line 4 (optocoupler input) - active edge of line 4 increments the counter.
- LvCounterEventSource_Line17*** Switches counter event signal to line 17 (TTL input) - active edge of line 17 increments the counter.
- LvCounterEventSource_Line18*** Switches counter event signal to line 18 (TTL input) - active edge of line 18 increments the counter.

Definition at line 4707 of file sv.synview.enums.h.

5.30.2.17 enum `LvCounterMode`

Enum values for the `LvDevice_LvCounterMode` feature.

Enumerator

`LvCounterMode_Autoreset` Automatic reset mode. Once completed, the counter automatically resets itself and starts counting again.

Definition at line 4695 of file `sv.synview.enums.h`.

5.30.2.18 enum `LvCounterSelector`

Enum values for the `LvDevice_CounterSelector` feature.

Enumerator

`LvCounterSelector_Counter1` Selects counter 1 for configuration.

`LvCounterSelector_Counter2` Selects counter 2 for configuration.

`LvCounterSelector_Counter3` Selects counter 3 for configuration.

`LvCounterSelector_Counter4` Selects counter 4 for configuration.

Definition at line 4674 of file `sv.synview.enums.h`.

5.30.2.19 enum `LvDeviceAccess`

This enum is used for opening the Device - see `LvDeviceOpen()`.

Enumerator

`LvDeviceAccess_Unknown` Represents the GenTL `DEVICE_ACCESS_UNKNOWN`.

`LvDeviceAccess_None` Represents the GenTL `DEVICE_ACCESS_NONE`. This either means that the Device is not open because it was not opened before or the access to it was denied.

`LvDeviceAccess_ReadOnly` Represents the GenTL `DEVICE_ACCESS_READONLY`. Open the Device read only. All Port functions can only read from the Device.

`LvDeviceAccess_Control` Represents the GenTL `DEVICE_ACCESS_CONTROL`. Open the Device in a way that other hosts/processes can have read only access to the Device. Device access level is read/write for this process.

`LvDeviceAccess_Exclusive` Represents the GenTL `DEVICE_ACCESS_EXCLUSIVE`. Open the Device in a way that only this host/process can have access to the Device. Device access level is read/write for this process.

Definition at line 4039 of file `sv.synview.enums.h`.

5.30.2.20 enum `LvDeviceAccessStatus`

Values for the `LvFtrInfo_DeviceAccessStatus`, `LvInterface_DeviceAccessStatus` and `LvDevice_DeviceAccessStatus` features.

Enumerator

`LvDeviceAccessStatus_Unknown` Represents the GenTL `DEVICE_ACCESS_STATUS_UNKNOWN`. The current availability of the Device is unknown.

`LvDeviceAccessStatus_ReadWrite` Represents the GenTL `DEVICE_ACCESS_STATUS_READWRITE` - The Device is available for Read/Write.

LvDeviceAccessStatus_ReadOnly Represents the GenTL DEVICE_ACCESS_STATUS_READONLY - The Device is available only for Read access (cannot be controlled).

LvDeviceAccessStatus_NoAccess Represents the GenTL DEVICE_ACCESS_STATUS_NOACCESS - The Device is not available either because it is already open or because it is not reachable.

LvDeviceAccessStatus_Busy Represents the GenTL DEVICE_ACCESS_STATUS_BUSY - The Device is already opened by another entity.

LvDeviceAccessStatus_OpenReadWrite Represents the GenTL DEVICE_ACCESS_STATUS_OPEN_READWRITE - The Device is open and available for Read/Write..

LvDeviceAccessStatus_OpenReadOnly Represents the GenTL DEVICE_ACCESS_STATUS_OPEN_READ - The Device is open and available only for Read access.

Definition at line 4070 of file sv.synview.enums.h.

5.30.2.21 enum LvDeviceClockSelector

Enum values for the [LvDevice_DeviceClockSelector](#) feature.

Enumerator

LvDeviceClockSelector_SensorDigitization Sensor digitization clock.

Definition at line 4122 of file sv.synview.enums.h.

5.30.2.22 enum LvDeviceEndiannessMechanism

Enum values for the [LvDevice_DeviceEndiannessMechanism](#) feature.

Enumerator

LvDeviceEndiannessMechanism_Legacy Legacy endianness handling mode, intended for GigE Vision remote devices using GenICam schema version 1.0.

LvDeviceEndiannessMechanism_Standard Standard endianness handling mode, intended for GigE Vision remote devices using GenICam schema version 1.1 and newer.

Definition at line 6393 of file sv.synview.enums.h.

5.30.2.23 enum LvDeviceScanType

Enum values for the [LvDevice_DeviceScanType](#) feature.

Enumerator

LvDeviceScanType_Areascan Indicates area scan sensor.

LvDeviceScanType_Linescan Indicates linr scan sensor.

Definition at line 4108 of file sv.synview.enums.h.

5.30.2.24 enum LvDeviceTemperatureSelector

Enum values for the [LvDevice_DeviceTemperatureSelector](#) feature.

Enumerator

LvDeviceTemperatureSelector_Sensor Temperature on sensor

LvDeviceTemperatureSelector_Mainboard Temperature on main board

LvDeviceTemperatureSelector_FPGA Temperature on fpga chip

Definition at line 4134 of file sv.synview.enums.h.

5.30.2.25 enum `LvDeviceType`

Enum values for the `LvDevice_DeviceType` feature.

Enumerator

`LvDeviceType_Custom` Device based on a custom technology.

`LvDeviceType_GEV` GigE Vision compatible device.

`LvDeviceType_U3V` USB3 Vision compatible device.

`LvDeviceType_ICUBE` ICube device.

`LvDeviceType_SIM` Sim device.

Definition at line 5726 of file `sv.synview.enums.h`.

5.30.2.26 enum `LvEventNotification`

Enum values for the `LvDevice_EventNotification` feature.

Enumerator

`LvEventNotification_Off` The notifications for the selected event are deactivated.

`LvEventNotification_On` The notifications for the selected event are activated.

Definition at line 5660 of file `sv.synview.enums.h`.

5.30.2.27 enum `LvEventSelector`

Enum values for the `LvDevice_EventSelector` feature.

Enumerator

`LvEventSelector_LvLog` This enumeration value selects the log event for configuration.

`LvEventSelector_LvSmartAppLog` This enumeration value selects the smart application log event for configuration.

`LvEventSelector_LvSmartAppString` This enumeration value selects the smart application string event for configuration.

`LvEventSelector_LvSmartAppInt` This enumeration value selects the smart application signed integer event for configuration.

`LvEventSelector_LvSmartAppUInt` This enumeration value selects the smart application unsigned integer event for configuration.

`LvEventSelector_LvSmartAppRegister` This enumeration value selects the smart application raw register event for configuration.

`LvEventSelector_LvTriggerDropped` This enumeration value selects the dropped trigger event for configuration.

Definition at line 5629 of file `sv.synview.enums.h`.

5.30.2.28 enum `LvExposureAuto`

Enum values for the `LvDevice_ExposureAuto` feature.

Enumerator

`LvExposureAuto_Off` Automatic exposure mode off - the automatic exposure is not applied.

LvExposureAuto_Once Automatic exposure mode once - the exposure time is once adjusted, then switches back to off.

LvExposureAuto_Continuous Automatic exposure mode continuous - the exposure time is continuously auto-adjusted.

Definition at line 4187 of file sv.synview.enums.h.

5.30.2.29 enum LvExposureMode

Enum values for the [LvDevice_ExposureMode](#) feature.

Enumerator

LvExposureMode_Timed Timed exposure mode - the exposure time is controlled by corresponding feature.

Definition at line 4415 of file sv.synview.enums.h.

5.30.2.30 enum LvExternalADCSelector

Enum values for the [LvDevice_LvExternalADCSelector](#) feature.

Enumerator

LvExternalADCSelector_ExternalADC1 Selects external ADC 1 for configuration.

LvExternalADCSelector_ExternalADC2 Selects external ADC 2 for configuration.

LvExternalADCSelector_ExternalADC3 Selects external ADC 3 for configuration.

LvExternalADCSelector_ExternalADC4 Selects external ADC 4 for configuration.

Definition at line 5137 of file sv.synview.enums.h.

5.30.2.31 enum LvExternalDeviceControlMode

Enum values for the [LvDevice_LvExternalDeviceControlMode](#) feature.

Enumerator

LvExternalDeviceControlMode_Custom Selects the custom mode.

Definition at line 5125 of file sv.synview.enums.h.

5.30.2.32 enum LvGainAuto

Enum values for the [LvDevice_GainAuto](#) feature.

Enumerator

LvGainAuto_Off Automatic gain mode off - the gain value is controlled 'manually'.

LvGainAuto_Once Automatic gain mode 'once' - the gain value is calculated and applied once and the feature switches back to 'off' (manual mode).

LvGainAuto_Continuous Continuous automatic gain mode - the AGC is applied continuously.

Definition at line 5011 of file sv.synview.enums.h.

5.30.2.33 enum LvGainSelector

Enum values for the [LvDevice_GainSelector](#) feature.

Enumerator

- LvGainSelector_All** Apply gain on all channels and taps.
- LvGainSelector_AnalogAll** Apply analog gain.
- LvGainSelector_DigitalAll** Apply digital gain.
- LvGainSelector_Red** Apply gain on all red channels.
- LvGainSelector_Green** Apply gain on all green channels.
- LvGainSelector_Blue** Apply gain on all blue channels.
- LvGainSelector_AnalogRed** Apply analog gain on red channel.
- LvGainSelector_AnalogGreen** Apply analog gain on green channel.
- LvGainSelector_AnalogBlue** Apply analog gain on blue channel.
- LvGainSelector_DigitalRed** Apply digital gain on red channel.
- LvGainSelector_DigitalGreen** Apply digital gain on green channel.
- LvGainSelector_DigitalBlue** Apply digital gain on blue channel.
- LvGainSelector_DigitalY** Apply digital gain on Y channel.
- LvGainSelector_DigitalU** Apply digital gain on U channel.
- LvGainSelector_DigitalV** Apply digital gain on V channel.

Definition at line 4956 of file sv.synview.enums.h.

5.30.2.34 enum LvGevCCP

Enum values for the [LvDevice_GevCCP](#) feature.

Enumerator

- LvGevCCP_OpenAccess** Sets the control channel privilege feature to open.
- LvGevCCP_ExclusiveAccess** Sets the control channel privilege feature to exclusive.
- LvGevCCP_ControlAccess** Sets the control channel privilege feature to control.
- LvGevCCP_ControlAccessSwitchoverActive** Sets the control channel privilege feature to control with switchover active.

Definition at line 5421 of file sv.synview.enums.h.

5.30.2.35 enum LvGevDeviceClass

Enum values for the [LvDevice_GevDeviceClass](#) feature.

Enumerator

- LvGevDeviceClass_Transmitter** Indicates that the device is a GigE Vision transmitter.

Definition at line 6345 of file sv.synview.enums.h.

5.30.2.36 enum LvGevDeviceModeCharacterSet

Enum values for the [LvDevice_GevDeviceModeCharacterSet](#) feature.

Enumerator

- LvGevDeviceModeCharacterSet_UTF8** Indicates that the camera uses the UTF8 character set.

Definition at line 5319 of file sv.synview.enums.h.

5.30.2.37 enum LvGevDeviceStreamCaptureMode

Enum values for the [LvDevice_LvGevDeviceStreamCaptureMode](#) feature.

Enumerator

LvGevDeviceStreamCaptureMode_SystemDefault System default mode, configurable in the ini file.

LvGevDeviceStreamCaptureMode_Socket Socket mode, the GVSP stream is processed through the socket interface (regular operating system networks stack).

LvGevDeviceStreamCaptureMode_FilterDriver Filter driver mode, the GVSP stream is processed through the filter driver interface (bypassing operating system network stack).

Definition at line 5790 of file sv.synview.enums.h.

5.30.2.38 enum LvGevIPConfigurationStatus

Enum values for the [LvDevice_GevIPConfigurationStatus](#) feature.

Enumerator

LvGevIPConfigurationStatus_None No IP configuration method was executed or it is not known.

LvGevIPConfigurationStatus_PersistentIP The current device IP configuration was obtained through persistent IP.

LvGevIPConfigurationStatus_DHCP The current device IP configuration was obtained through DHCP.

LvGevIPConfigurationStatus_LLA The current device IP configuration was obtained through LLA.

LvGevIPConfigurationStatus_ForceIP The current device IP configuration was obtained through ForceIP.

Definition at line 6357 of file sv.synview.enums.h.

5.30.2.39 enum LvGevSCPDirection

Enum values for the [LvDevice_GevSCPDirection](#) feature.

Enumerator

LvGevSCPDirection_Transmitter Indicates that the stream channel is a transmitter.

Definition at line 6381 of file sv.synview.enums.h.

5.30.2.40 enum LvGevSupportedOptionSelector

Enum values for the [LvDevice_GevSupportedOptionSelector](#) feature.

Enumerator

LvGevSupportedOptionSelector_IPConfigurationLLA Indicates whether the (first) network interface supports auto IP addressing (also known as LLA).

LvGevSupportedOptionSelector_IPConfigurationDHCP Indicates whether the (first) network interface supports DHCP IP addressing.

LvGevSupportedOptionSelector_IPConfigurationPersistentIP Indicates whether the (first) network interface supports fixed IP addressing (also known as persistent IP addressing).

LvGevSupportedOptionSelector_CommandsConcatenation Indicates whether command concatenation is supported by the device.

LvGevSupportedOptionSelector_WriteMem Indicates whether write memory scheme is supported by the device.

- LvGevSupportedOptionSelector_PacketResend*** Indicates whether packet resend is supported by the device.
- LvGevSupportedOptionSelector_Event*** Indicates whether event (message channel) is supported by the device.
- LvGevSupportedOptionSelector_EventData*** Indicates whether eventdata (message channel) is supported by the device.
- LvGevSupportedOptionSelector_PendingAck*** Indicates whether pending acknowledge is supported by the device.
- LvGevSupportedOptionSelector_Action*** Indicates whether action commands are supported by the device.
- LvGevSupportedOptionSelector_PrimaryApplicationSwitchover*** Indicates whether primary application switchover is supported by the device.
- LvGevSupportedOptionSelector_ExtendedStatusCodes*** Indicates whether extended GigE Vision status codes are supported by the device.
- LvGevSupportedOptionSelector_DiscoveryAckDelayWritable*** Indicates whether writable discovery acknowledge delay is supported by the device.
- LvGevSupportedOptionSelector_DiscoveryAckDelay*** Indicates whether discovery acknowledge delay is supported by the device.
- LvGevSupportedOptionSelector_TestData*** Indicates whether test data is supported by the device.
- LvGevSupportedOptionSelector_ManifestTable*** Indicates whether manifest table is supported by the device.
- LvGevSupportedOptionSelector_CCPApplicationSocket*** Indicates whether the primary application port and IP address features are supported by the device.
- LvGevSupportedOptionSelector_LinkSpeed*** Indicates whether link speed feature is supported by the device.
- LvGevSupportedOptionSelector_HeartbeatDisable*** Indicates whether heartbeat disabling is supported by the device.
- LvGevSupportedOptionSelector_SerialNumber*** Indicates whether serial number feature is supported by the device.
- LvGevSupportedOptionSelector_UserDefinedName*** Indicates whether user defined name is supported by the device.
- LvGevSupportedOptionSelector_StreamChannelSourceSocket*** Indicates whether the stream channel source port feature is supported by the device.
- LvGevSupportedOptionSelector_StreamChannel0ExtendedChunkData*** Indicates whether the extended chunk data is supported by the device.
- LvGevSupportedOptionSelector_StreamChannel0UnconditionalStreaming*** Indicates whether the unconditional streaming is supported by the device.
- LvGevSupportedOptionSelector_StreamChannel0IPReassembly*** Indicates whether the reassembly of fragmented IP packets is supported by the device.
- LvGevSupportedOptionSelector_StreamChannel0BigAndLittleEndian*** Indicates whether the big and little endian stream channel is supported by the device.
- LvGevSupportedOptionSelector_MessageChannelSourceSocket*** Indicates whether the message channel source port feature is supported by the device.

Definition at line 5331 of file sv.synview.enums.h.

5.30.2.41 enum LvImageStampSelector

Enum values for the [LvDevice_LvImageStampSelector](#) feature.

Enumerator

- LvImageStampSelector_Timestamp*** Selects the flag controlling reset of the image timestamp

LvImageStampSelector_FrameID Selects the flag controlling reset of the image frame ID

Definition at line 4926 of file sv.synview.enums.h.

5.30.2.42 enum **LvInterfaceType**

Enum values for the [LvInterface_InterfaceType](#) feature.

Enumerator

LvInterfaceType_Custom Interface supporting a custom technology devices.

LvInterfaceType_GEV Interface supporting GigE Vision devices.

LvInterfaceType_U3V Interface supporting USB3 Vision devices.

LvInterfaceType_ICUBE Interface supporting ICube devices.

LvInterfaceType_SIM Interface supporting Sim devices.

Definition at line 5702 of file sv.synview.enums.h.

5.30.2.43 enum **LvLensControlCalibrationStatus**

Enum values for the [LvDevice_LvLensControlCalibrationStatus](#) feature.

Enumerator

LvLensControlCalibrationStatus_Invalid Current calibration parameters are invalid

LvLensControlCalibrationStatus_Valid Current calibration parameters are valid

Definition at line 6274 of file sv.synview.enums.h.

5.30.2.44 enum **LvLensControlTargetApproach**

Enum values for the [LvDevice_LvLensControlTargetApproach](#) feature.

Enumerator

LvLensControlTargetApproach_Direct Approaches the target position directly, no matter from which side.

LvLensControlTargetApproach_FromPlus Approaches the target position always from the plus side to improve accuracy.

LvLensControlTargetApproach_FromMinus Approaches the target position always from the minus side to improve accuracy.

Definition at line 5280 of file sv.synview.enums.h.

5.30.2.45 enum **LvLineDebounceMode**

Enum values for the [LvDevice_LineMode](#) feature.

Enumerator

LvLineDebounceMode_Debounce The line debounce filter is used in debounce mode.

LvLineDebounceMode_Deglitch The line debounce filter is used in deglitch mode.

Definition at line 4658 of file sv.synview.enums.h.

5.30.2.46 enum LvLineFormat

Enum values for the [LvDevice_LineFormat](#) feature.

Enumerator

LvLineFormat_NoConnect Not connected line.

LvLineFormat_TriState The Line is currently in Tri-state mode (Not driven).

LvLineFormat_TTL The Line is currently accepting or sending TTL level signals.

LvLineFormat_LVDS The Line is currently accepting or sending LVDS level signals.

LvLineFormat_RS422 The Line is currently accepting or sending RS-422 level signals.

LvLineFormat_OptoCoupled Optically isolated line (optocoupler).

Definition at line 4568 of file sv.synview.enums.h.

5.30.2.47 enum LvLineMode

Enum values for the [LvDevice_LineMode](#) feature.

Enumerator

LvLineMode_Input The line is used as signal input.

LvLineMode_Output The line is used as signal output.

Definition at line 4553 of file sv.synview.enums.h.

5.30.2.48 enum LvLineSelector

Enum values for the [LvDevice_LineSelector](#) feature.

Enumerator

LvLineSelector_Line1 Selects device's logical line 1 (optocoupler input).

LvLineSelector_Line2 Selects device's logical line 2 (optocoupler input).

LvLineSelector_Line3 Selects device's logical line 3 (optocoupler input).

LvLineSelector_Line4 Selects device's logical line 4 (optocoupler input).

LvLineSelector_Line5 Selects device's logical line 5.

LvLineSelector_Line6 Selects device's logical line 6.

LvLineSelector_Line7 Selects device's logical line 7.

LvLineSelector_Line8 Selects device's logical line 8.

LvLineSelector_Line9 Selects device's logical line 9 (optocoupler output).

LvLineSelector_Line10 Selects device's logical line 10 (optocoupler output).

LvLineSelector_Line11 Selects device's logical line 11 (optocoupler output).

LvLineSelector_Line12 Selects device's logical line 12 (optocoupler output).

LvLineSelector_Line13 Selects device's logical line 13.

LvLineSelector_Line14 Selects device's logical line 14.

LvLineSelector_Line15 Selects device's logical line 15.

LvLineSelector_Line16 Selects device's logical line 16.

LvLineSelector_Line17 Selects device's logical line 17 (TTL input).

LvLineSelector_Line18 Selects device's logical line 18 (TTL input).

LvLineSelector_Line19 Selects device's logical line 19.

- LvLineSelector_Line20*** Selects device's logical line 20.
- LvLineSelector_Line21*** Selects device's logical line 21.
- LvLineSelector_Line22*** Selects device's logical line 22.
- LvLineSelector_Line23*** Selects device's logical line 23.
- LvLineSelector_Line24*** Selects device's logical line 24.
- LvLineSelector_Line25*** Selects device's logical line 25 (TTL output).
- LvLineSelector_Line26*** Selects device's logical line 26 (TTL output).
- LvLineSelector_Line27*** Selects device's logical line 27.
- LvLineSelector_Line28*** Selects device's logical line 28.
- LvLineSelector_Line29*** Selects device's logical line 29.
- LvLineSelector_Line30*** Selects device's logical line 30.
- LvLineSelector_Line31*** Selects device's logical line 31.
- LvLineSelector_Line32*** Selects device's logical line 32.

Definition at line 4447 of file sv.synview.enums.h.

5.30.2.49 enum LvLineSource

Enum values for the [LvDevice_LineSource](#) feature.

Enumerator

- LvLineSource_Off*** Switches the line source off. This disables the line output (disconnects the line).
- LvLineSource_ExposureActive*** Selects exposure active signal as line source.
- LvLineSource_Timer1Active*** Selects timer 1 active signal as line source.
- LvLineSource_Timer2Active*** Selects timer 2 active signal as line source.
- LvLineSource_Timer3Active*** Selects timer 3 active signal as line source.
- LvLineSource_Timer4Active*** Selects timer 4 active signal as line source.
- LvLineSource_UserOutput1*** Selects user output 1 value signal as line source.
- LvLineSource_UserOutput2*** Selects user output 2 value signal as line source.
- LvLineSource_UserOutput3*** Selects user output 3 value signal as line source.
- LvLineSource_UserOutput4*** Selects user output 4 value signal as line source.
- LvLineSource_UserOutput5*** Selects user output 5 value signal as line source.
- LvLineSource_UserOutput6*** Selects user output 6 value signal as line source.
- LvLineSource_UserOutput7*** Selects user output 7 value signal as line source.
- LvLineSource_UserOutput8*** Selects user output 8 value signal as line source.
- LvLineSource_Counter1Active*** Selects counter 1 active signal as line source.
- LvLineSource_Counter2Active*** Selects counter 2 active signal as line source.
- LvLineSource_Counter3Active*** Selects counter 3 active signal as line source.
- LvLineSource_Counter4Active*** Selects counter 4 active signal as line source.

Definition at line 4595 of file sv.synview.enums.h.

5.30.2.50 enum LvLUTMode

Enum values for the [LvDevice_LvLUTMode](#) feature.

Enumerator

- LvLUTMode_Direct*** In this mode the LUT is controlled directly.
- LvLUTMode_BalanceWhite*** In this mode the LUT is controlled through the higher level features, such as brightness, contrast, gamma or white balance.

Definition at line 6290 of file sv.synview.enums.h.

5.30.2.51 enum `LvLUTSelector`

Enum values for the `LvDevice_LUTSelector` feature.

Enumerator

`LvLUTSelector_Luminance` Selects the luminance LUT for configuration.

`LvLUTSelector_Red` Selects the red LUT for configuration.

`LvLUTSelector_Green` Selects the green LUT for configuration.

`LvLUTSelector_Blue` Selects the blue LUT for configuration.

Definition at line 5298 of file `sv.synview.enums.h`.

5.30.2.52 enum `LvPixelFormat`

`LvPixelFormat` constants Enum for the `LvDevice_PixelFormat`, `LvDevice_ChunkPixelFormat` and `LvDevice_LvUniPixelFormat` features. The Pixel format constants are defined by the GenICam standard. The value consists of 3 parts:

- byte 1 - color/mono/custom
- byte 2 - bits per pixel
- byte 3 and 4 - ID of the pixel format

Exceptions are:

- `LvPixelFormat_BGR555Packed` - used only in the Image Processing Library (in conversions for display).

Enumerator

`LvPixelFormat_Mono8` Monochrome 8-bit. Defined as `(LV_PIX_MONO | LV_PIX_OCCUPY8BIT | 0x0001)`.

`LvPixelFormat_Mono8S` Monochrome 8-bit signed. Defined as `(LV_PIX_MONO | LV_PIX_OCCUPY8BIT | 0x0002)`.

`LvPixelFormat_Mono10` Monochrome 10-bit. Defined as `(LV_PIX_MONO | LV_PIX_OCCUPY16BIT | 0x0003)`.

`LvPixelFormat_Mono10Packed` Monochrome 10-bit packed. Defined as `(LV_PIX_MONO | LV_PIX_OCCUPY12BIT | 0x0004)`.

`LvPixelFormat_Mono12` Monochrome 12-bit. Defined as `(LV_PIX_MONO | LV_PIX_OCCUPY16BIT | 0x0005)`.

`LvPixelFormat_Mono12Packed` Monochrome 12-bit packed. Defined as `(LV_PIX_MONO | LV_PIX_OCCUPY12BIT | 0x0006)`.

`LvPixelFormat_Mono14` Monochrome 14-bit. Defined as `(LV_PIX_MONO | LV_PIX_OCCUPY16BIT | 0x0025)`.

`LvPixelFormat_Mono16` Monochrome 16-bit. Defined as `(LV_PIX_MONO | LV_PIX_OCCUPY16BIT | 0x0007)`.

`LvPixelFormat_BayerGR8` Undecoded 8-bit Bayer array with the GR array position. Defined as `(LV_PIX_MONO | LV_PIX_OCCUPY8BIT | 0x0008)`.

`LvPixelFormat_BayerRG8` Undecoded 8-bit Bayer array with the RG array position. Defined as `(LV_PIX_MONO | LV_PIX_OCCUPY8BIT | 0x0009)`.

`LvPixelFormat_BayerGB8` Undecoded 8-bit Bayer array with the GB array position. Defined as `(LV_PIX_MONO | LV_PIX_OCCUPY8BIT | 0x000A)`.

`LvPixelFormat_BayerBG8` Undecoded 8-bit Bayer array with the BG array position. Defined as `(LV_PIX_MONO | LV_PIX_OCCUPY8BIT | 0x000B)`.

- LvPixelFormat_BayerGR10** Undecoded 10-bit Bayer array with the GR array position. Defined as (LV_PIXEL_FORMAT_BAYERGR10 | LV_PIXEL_OCCUPY16BIT | 0x000C).
- LvPixelFormat_BayerRG10** Undecoded 10-bit Bayer array with the RG array position. Defined as (LV_PIXEL_FORMAT_BAYERRG10 | LV_PIXEL_OCCUPY16BIT | 0x000D).
- LvPixelFormat_BayerGB10** Undecoded 10-bit Bayer array with the GB array position. Defined as (LV_PIXEL_FORMAT_BAYERGB10 | LV_PIXEL_OCCUPY16BIT | 0x000E).
- LvPixelFormat_BayerBG10** Undecoded 10-bit Bayer array with the BG array position. Defined as (LV_PIXEL_FORMAT_BAYERBG10 | LV_PIXEL_OCCUPY16BIT | 0x000F).
- LvPixelFormat_BayerGR12** Undecoded 12-bit Bayer array with the GR array position. Defined as (LV_PIXEL_FORMAT_BAYERGR12 | LV_PIXEL_OCCUPY16BIT | 0x0010).
- LvPixelFormat_BayerRG12** Undecoded 12-bit Bayer array with the RG array position. Defined as (LV_PIXEL_FORMAT_BAYERRG12 | LV_PIXEL_OCCUPY16BIT | 0x0011).
- LvPixelFormat_BayerGB12** Undecoded 12-bit Bayer array with the GB array position. Defined as (LV_PIXEL_FORMAT_BAYERGB12 | LV_PIXEL_OCCUPY16BIT | 0x0012).
- LvPixelFormat_BayerBG12** Undecoded 12-bit Bayer array with the BG array position. Defined as (LV_PIXEL_FORMAT_BAYERBG12 | LV_PIXEL_OCCUPY16BIT | 0x0013).
- LvPixelFormat_BayerGR10Packed** Undecoded 10-bit packed Bayer array with the GR array position. Defined as (LV_PIXEL_FORMAT_BAYERGR10PACKED | LV_PIXEL_OCCUPY12BIT | 0x0026).
- LvPixelFormat_BayerRG10Packed** Undecoded 10-bit packed Bayer array with the RG array position. Defined as (LV_PIXEL_FORMAT_BAYERRG10PACKED | LV_PIXEL_OCCUPY12BIT | 0x0027).
- LvPixelFormat_BayerGB10Packed** Undecoded 10-bit packed Bayer array with the GB array position. Defined as (LV_PIXEL_FORMAT_BAYERGB10PACKED | LV_PIXEL_OCCUPY12BIT | 0x0028).
- LvPixelFormat_BayerBG10Packed** Undecoded 10-bit packed Bayer array with the BG array position. Defined as (LV_PIXEL_FORMAT_BAYERBG10PACKED | LV_PIXEL_OCCUPY12BIT | 0x0029).
- LvPixelFormat_BayerGR12Packed** Undecoded 12-bit packed Bayer array with the GR array position. Defined as (LV_PIXEL_FORMAT_BAYERGR12PACKED | LV_PIXEL_OCCUPY12BIT | 0x002A).
- LvPixelFormat_BayerRG12Packed** Undecoded 12-bit packed Bayer array with the RG array position. Defined as (LV_PIXEL_FORMAT_BAYERRG12PACKED | LV_PIXEL_OCCUPY12BIT | 0x002B).
- LvPixelFormat_BayerGB12Packed** Undecoded 12-bit packed Bayer array with the GB array position. Defined as (LV_PIXEL_FORMAT_BAYERGB12PACKED | LV_PIXEL_OCCUPY12BIT | 0x002C).
- LvPixelFormat_BayerBG12Packed** Undecoded 10-bit packed Bayer array with the BG array position. Defined as (LV_PIXEL_FORMAT_BAYERBG12PACKED | LV_PIXEL_OCCUPY12BIT | 0x002D).
- LvPixelFormat_BayerGR16** Undecoded 16-bit Bayer array with the GR array position. Defined as (LV_PIXEL_FORMAT_BAYERGR16 | LV_PIXEL_OCCUPY16BIT | 0x002E).
- LvPixelFormat_BayerRG16** Undecoded 16-bit Bayer array with the RG array position. Defined as (LV_PIXEL_FORMAT_BAYERRG16 | LV_PIXEL_OCCUPY16BIT | 0x002F).
- LvPixelFormat_BayerGB16** Undecoded 16-bit Bayer array with the GB array position. Defined as (LV_PIXEL_FORMAT_BAYERGB16 | LV_PIXEL_OCCUPY16BIT | 0x0030).
- LvPixelFormat_BayerBG16** Undecoded 16-bit Bayer array with the BG array position. Defined as (LV_PIXEL_FORMAT_BAYERBG16 | LV_PIXEL_OCCUPY16BIT | 0x0031).
- LvPixelFormat_RGB8** RGB 24-bit packed (3x8 bits). Defined as (LV_PIXEL_FORMAT_RGB8 | LV_PIXEL_OCCUPY24BIT | 0x0014).
- LvPixelFormat_BGR8** BGR 24-bit packed (3x8 bits). Defined as (LV_PIXEL_FORMAT_BGR8 | LV_PIXEL_OCCUPY24BIT | 0x0015).
- LvPixelFormat_RGBA8** RGB 32-bit packed (3x8 bits + 1x8 bits alpha). Defined as (LV_PIXEL_FORMAT_RGBA8 | LV_PIXEL_OCCUPY32BIT | 0x0016).
- LvPixelFormat_BGRA8** BGR 32-bit packed (3x8 bits + 1x8 bits alpha). Defined as (LV_PIXEL_FORMAT_BGRA8 | LV_PIXEL_OCCUPY32BIT | 0x0017).
- LvPixelFormat_RGB10** RGB 48-bit packed (3x10 bits). Defined as (LV_PIXEL_FORMAT_RGB10 | LV_PIXEL_OCCUPY48BIT | 0x0018).

- LvPixelFormat_BGR10** BGR 48-bit packed (3x10 bits). Defined as (LV_PIX_COLOR | LV_PIX_OCCUP↵
Y48BIT | 0x0019).
- LvPixelFormat_RGB12** RGB 48-bit packed (3x12 bits). Defined as (LV_PIX_COLOR | LV_PIX_OCCUP↵
Y48BIT | 0x001A).
- LvPixelFormat_BGR12** BGR 48-bit packed (3x12 bits). Defined as (LV_PIX_COLOR | LV_PIX_OCCUP↵
Y48BIT | 0x001B).
- LvPixelFormat_RGB16** RGB 48-bit packed (3x16 bits). Defined as (LV_PIX_COLOR | LV_PIX_OCCUP↵
Y48BIT | 0x0033).
- LvPixelFormat_BGR16** BGR 48-bit packed (3x16 bits). Defined as (LV_PIX_COLOR | LV_PIX_OCCUP↵
Y48BIT | 0x004B).
- LvPixelFormat_RGB10V1Packed** RGB 32-bit packed (3x10 bits). Defined as (LV_PIX_COLOR | LV_PIX↵
_OCCUPY32BIT | 0x001C).
- LvPixelFormat_RGB10P32** RGB 32-bit packed (3x10 bits). Defined as (LV_PIX_COLOR | LV_PIX_OCC↵
UPY32BIT | 0x001D).
- LvPixelFormat_RGB12V1Packed** RGB 36-bit packed (3x12 bits). Defined as (LV_PIX_COLOR | LV_PIX↵
_OCCUPY36BIT | 0x0034).
- LvPixelFormat_RGB565P** RGB 16-bit packed (5,6,5 bits). Defined as (LV_PIX_COLOR | LV_PIX_OCCU↵
PY16BIT | 0x0035).
- LvPixelFormat_BGR565P** BGR 16-bit packed (5,6,5 bits). Defined as (LV_PIX_COLOR | LV_PIX_OCCU↵
PY16BIT | 0x0036).
- LvPixelFormat_YUV411_8** YUV 4-1-1 Packed. Defined as (LV_PIX_COLOR | LV_PIX_OCCUPY12BIT |
0x001E).
- LvPixelFormat_YUV422_8_UYVY** YUV 4-2-2 UYVY Packed. Defined as (LV_PIX_COLOR | LV_PIX_OC↵
CUPY16BIT | 0x001F).
- LvPixelFormat_YUV8** YUV 4-4-4 Packed. Defined as (LV_PIX_COLOR | LV_PIX_OCCUPY24BIT | 0x0020).
- LvPixelFormat_YUV422_8** YUV 4-2-2 YUYV Packed. Defined as (LV_PIX_COLOR | LV_PIX_OCCUPY16↵
BIT | 0x0032).
- LvPixelFormat_YCbCr422_8** YCbCr 4-2-2 Packed. Defined as (LV_PIX_COLOR | LV_PIX_OCCUPY16BIT
| 0x003B).
- LvPixelFormat_YCbCr601_422_8** YCbCr 4-2-2 Packed. Defined as (LV_PIX_COLOR | LV_PIX_OCCUP↵
Y16BIT | 0x003E).
- LvPixelFormat_YCbCr601_422_8_CbYCrY** YCbCr 4-2-2 Packed. Defined as (LV_PIX_COLOR | LV_PIX↵
_OCCUPY16BIT | 0x0044).
- LvPixelFormat_YCbCr422_8_CbYCrY** YCbCr 4:2:2 8-bit. Defined as (LV_PIX_COLOR | LV_PIX_OCCU↵
PY16BIT | 0x0043).
- LvPixelFormat_RGB8_Planar** RGB 8-bit planar. Defined as (LV_PIX_COLOR | LV_PIX_OCCUPY24BIT |
0x0021).
- LvPixelFormat_RGB10_Planar** RGB 10-bit planar. Defined as (LV_PIX_COLOR | LV_PIX_OCCUPY48BIT
| 0x0022).
- LvPixelFormat_RGB12_Planar** RGB 12-bit planar. Defined as (LV_PIX_COLOR | LV_PIX_OCCUPY48BIT
| 0x0023).
- LvPixelFormat_RGB16_Planar** RGB 16-bit planar. Defined as (LV_PIX_COLOR | LV_PIX_OCCUPY48BIT
| 0x0024).
- LvPixelFormat_BGR555P** RGB 15-bit packed (3x5 bits). Defined as (LV_PIX_COLOR | LV_PIX_OCCUP↵
Y16BIT | 0x00E1). Not a standard GenICam format, used only in the image processing library.

Definition at line 3920 of file sv.synview.enums.h.

5.30.2.53 enum LvPowerSwitchBoundADC

Enum values for the [LvDevice_LvPowerSwitchBoundADC](#) feature.

Enumerator

- LvPowerSwitchBoundADC_None*** Binds no external ADC to the power switch
- LvPowerSwitchBoundADC_ExternalADC1*** Binds external ADC 1 to the power switch
- LvPowerSwitchBoundADC_ExternalADC2*** Binds external ADC 2 to the power switch
- LvPowerSwitchBoundADC_ExternalADC3*** Binds external ADC 3 to the power switch
- LvPowerSwitchBoundADC_ExternalADC4*** Binds external ADC 4 to the power switch

Definition at line 5256 of file sv.synview.enums.h.

5.30.2.54 enum LvPowerSwitchCurrentAction

Enum values for the [LvDevice_LvPowerSwitchCurrentAction](#) feature.

Enumerator

- LvPowerSwitchCurrentAction_Idle*** Reports that all power switches are idle
- LvPowerSwitchCurrentAction_Pulse*** Reports that a pulse command is pending
- LvPowerSwitchCurrentAction_Calibrate*** Reports that a calibration is pending
- LvPowerSwitchCurrentAction_AdjustPosition*** Reports that a position adjustment is pending
- LvPowerSwitchCurrentAction_Drive*** Reports that a power switch drive operation is pending

Definition at line 5175 of file sv.synview.enums.h.

5.30.2.55 enum LvPowerSwitchDrive

Enum values for the [LvDevice_LvPowerSwitchDrive](#) feature.

Enumerator

- LvPowerSwitchDrive_Off*** Switches the selected power switch off.
- LvPowerSwitchDrive_Plus*** Switches the selected power switch to plus polarity.
- LvPowerSwitchDrive_Minus*** Switches the selected power switch to minus polarity.

Definition at line 5220 of file sv.synview.enums.h.

5.30.2.56 enum LvPowerSwitchDriveAll

Enum values for the [LvPowerSwitchDriveAll](#) feature.

Enumerator

- LvPowerSwitchDriveAll_Off*** Switches the active power switches off
- LvPowerSwitchDriveAll_Plus*** Switches the active power switches to plus polarity
- LvPowerSwitchDriveAll_Minus*** Switches the active power switches to minus polarity

Definition at line 5238 of file sv.synview.enums.h.

5.30.2.57 enum `LvPowerSwitchSelector`

Enum values for the [LvDevice_LvPowerSwitchSelector](#) feature.

Enumerator

- `LvPowerSwitchSelector_PowerSwitch1`** Selects power switch 1 for configuration.
- `LvPowerSwitchSelector_PowerSwitch2`** Selects power switch 2 for configuration.
- `LvPowerSwitchSelector_PowerSwitch3`** Selects power switch 3 for configuration.
- `LvPowerSwitchSelector_PowerSwitch4`** Selects power switch 4 for configuration.

Definition at line 5199 of file `sv.synview.enums.h`.

5.30.2.58 enum `LvRegionSelector`

Enum values for the [LvDevice_RegionSelector](#) feature.

Enumerator

- `LvRegionSelector_Region0`** Selects region 0 for configuration.
- `LvRegionSelector_Region1`** Selects region 1 for configuration.
- `LvRegionSelector_Region2`** Selects region 2 for configuration.
- `LvRegionSelector_Region3`** Selects region 3 for configuration.

Definition at line 6523 of file `sv.synview.enums.h`.

5.30.2.59 enum `LvRenderType`

Enum values for the [LvRenderer_LvRenderType](#) feature.

Enumerator

- `LvRenderType_FullSize`** Renders the acquired image in full size.
- `LvRenderType_ScaleToFit`** Renders the acquired image to fit into the window.
- `LvRenderType_ScaleToSize`** Renders the acquired image scaled to required size.
- `LvRenderType_ScaleToTiles`** Renders the acquired images in tiles.

Definition at line 5983 of file `sv.synview.enums.h`.

5.30.2.60 enum `LvSerialPortBaudRate`

Enum values for the [LvDevice_LvSerialPortBaudRate](#) feature.

Enumerator

- `LvSerialPortBaudRate_Baud2400`** Baud rate of 2400 bauds.
- `LvSerialPortBaudRate_Baud4800`** Baud rate of 4800 bauds.
- `LvSerialPortBaudRate_Baud9600`** Baud rate of 9600 bauds.
- `LvSerialPortBaudRate_Baud14400`** Baud rate of 14400 bauds.
- `LvSerialPortBaudRate_Baud19200`** Baud rate of 19200 bauds.
- `LvSerialPortBaudRate_Baud38400`** Baud rate of 38400 bauds.
- `LvSerialPortBaudRate_Baud57600`** Baud rate of 57600 bauds.
- `LvSerialPortBaudRate_Baud115200`** Baud rate of 115200 bauds.

Definition at line 6078 of file `sv.synview.enums.h`.

5.30.2.61 enum LvSerialPortCommandStatus

Enum values for the [LvDevice_LvSerialPortCommandStatus](#) feature.

Enumerator

- LvSerialPortCommandStatus_Success*** Last command was successfully transferred.
- LvSerialPortCommandStatus_Timeout*** Last command ended with timeout (depending on configuration this might be problem or not).
- LvSerialPortCommandStatus_PortBusy*** Last command failed: port busy.
- LvSerialPortCommandStatus_CommunicationError*** Last command failed: generic communication error.
- LvSerialPortCommandStatus_FrameError*** Last command failed: frame error.
- LvSerialPortCommandStatus_ParityError*** Last command failed: parity error.
- LvSerialPortCommandStatus_Overflow*** Last command failed: overflow.

Definition at line 6162 of file sv.synview.enums.h.

5.30.2.62 enum LvSerialPortDataBits

Enum values for the [LvDevice_LvSerialPortDataBits](#) feature.

Enumerator

- LvSerialPortDataBits_DataBits7*** 7 data bits per character.
- LvSerialPortDataBits_DataBits8*** 8 data bits per character.

Definition at line 6129 of file sv.synview.enums.h.

5.30.2.63 enum LvSerialPortParity

Enum values for the [LvDevice_LvSerialPortParity](#) feature.

Enumerator

- LvSerialPortParity_None*** Parity method 'none', parity bit not used.
- LvSerialPortParity_Odd*** Parity method 'odd', odd number of set bits in each character.
- LvSerialPortParity_Even*** Parity method 'even', even number of set bits in each character.

Definition at line 6111 of file sv.synview.enums.h.

5.30.2.64 enum LvSerialPortStopBits

Enum values for the [LvDevice_LvSerialPortStopBits](#) feature.

Enumerator

- LvSerialPortStopBits_StopBits1*** 1 stop bit per character.
- LvSerialPortStopBits_StopBits1dot5*** 1.5 stop bit per character.
- LvSerialPortStopBits_StopBits2*** 2 stop bits per character.

Definition at line 6144 of file sv.synview.enums.h.

5.30.2.65 enum `LvSpecialPurposeTriggerActivation`

Enum values for the `LvDevice_LvSpecialPurposeTriggerActivation` feature.

Enumerator

`LvSpecialPurposeTriggerActivation_RisingEdge` Selects the trigger signal rising edge as active.

`LvSpecialPurposeTriggerActivation_FallingEdge` Selects the trigger signal falling edge as active

Definition at line 4911 of file `sv.synview.enums.h`.

5.30.2.66 enum `LvSpecialPurposeTriggerSelector`

Enum values for the `LvDevice_LvSpecialPurposeTriggerSelector` feature.

Enumerator

`LvSpecialPurposeTriggerSelector_ImageStampsReset` Timestamps reset trigger - controls reset of timestamp, frame ID and other image stamps.

Definition at line 4815 of file `sv.synview.enums.h`.

5.30.2.67 enum `LvSpecialPurposeTriggerSource`

Enum values for the `LvDevice_LvSpecialPurposeTriggerSource` feature.

Enumerator

`LvSpecialPurposeTriggerSource_Off` Sets trigger source off - it can be still be issued by an explicit software trigger

`LvSpecialPurposeTriggerSource_Line1` Sets the signal source for the selected trigger to line 1 (optocoupler input).

`LvSpecialPurposeTriggerSource_Line2` Sets the signal source for the selected trigger to line 2 (optocoupler input).

`LvSpecialPurposeTriggerSource_Line3` Sets the signal source for the selected trigger to line 3 (optocoupler input).

`LvSpecialPurposeTriggerSource_Line4` Sets the signal source for the selected trigger to line 4 (optocoupler input).

`LvSpecialPurposeTriggerSource_Line5` Sets the signal source for the selected trigger to line 5.

`LvSpecialPurposeTriggerSource_Line6` Sets the signal source for the selected trigger to line 6.

`LvSpecialPurposeTriggerSource_Line7` Sets the signal source for the selected trigger to line 7.

`LvSpecialPurposeTriggerSource_Line8` Sets the signal source for the selected trigger to line 8.

`LvSpecialPurposeTriggerSource_Line17` Sets the signal source for the selected trigger to line 17 (TT↔L input).

`LvSpecialPurposeTriggerSource_Line18` Sets the signal source for the selected trigger to line 18 (TT↔L input).

`LvSpecialPurposeTriggerSource_Line19` Sets the signal source for the selected trigger to line 19.

`LvSpecialPurposeTriggerSource_Line20` Sets the signal source for the selected trigger to line 20.

`LvSpecialPurposeTriggerSource_Line21` Sets the signal source for the selected trigger to line 21.

`LvSpecialPurposeTriggerSource_Line22` Sets the signal source for the selected trigger to line 22.

`LvSpecialPurposeTriggerSource_Line23` Sets the signal source for the selected trigger to line 23.

`LvSpecialPurposeTriggerSource_Line24` Sets the signal source for the selected trigger to line 24.

LvSpecialPurposeTriggerSource_Action1 Sets the signal source for the selected trigger to action signal 1.

LvSpecialPurposeTriggerSource_Action2 Sets the signal source for the selected trigger to action signal 2.

LvSpecialPurposeTriggerSource_Action3 Sets the signal source for the selected trigger to action signal 3.

LvSpecialPurposeTriggerSource_Action4 Sets the signal source for the selected trigger to action signal 4.

LvSpecialPurposeTriggerSource_Action5 Sets the signal source for the selected trigger to action signal 5.

LvSpecialPurposeTriggerSource_Action6 Sets the signal source for the selected trigger to action signal 6.

LvSpecialPurposeTriggerSource_Action7 Sets the signal source for the selected trigger to action signal 7.

LvSpecialPurposeTriggerSource_Action8 Sets the signal source for the selected trigger to action signal 8.

Definition at line 4827 of file sv.synview.enums.h.

5.30.2.68 enum `LvStreamAcquisitionModeSelector`

Enum values for the `LvStream_StreamAcquisitionModeSelector` feature.

Enumerator

LvStreamAcquisitionModeSelector_Default Default acquisition mode.

Definition at line 5808 of file sv.synview.enums.h.

5.30.2.69 enum `LvStreamType`

Enum values for the `LvStream_StreamType` feature.

Enumerator

LvStreamType_Custom Stream belonging to a custom technology device.

LvStreamType_GEV Stream belonging to a GigE Vision compatible device.

LvStreamType_U3V Stream belonging to a USB3 Vision compatible device.

LvStreamType_ICUBE Stream belonging to a ICube device.

LvStreamType_SIM Stream belonging to a Sim device.

Definition at line 5820 of file sv.synview.enums.h.

5.30.2.70 enum `LvStrobeDropMode`

Enum values for the `LvDevice_LvStrobeDropMode` feature.

Enumerator

LvStrobeDropMode_DropStrobe Strobe drop mode 'drop' - the strobe is dropped, image is acquired without the strobe.

LvStrobeDropMode_DelayFrame Strobe drop mode 'delay' - the frame acquisition is delayed, until the strobe can be issued.

Definition at line 6508 of file sv.synview.enums.h.

5.30.2.71 enum `LvStrobeDurationMode`

Enum values for the `LvDevice_LvStrobeDurationMode` feature.

Enumerator

`LvStrobeDurationMode_FrameRateRelated` The maximum strobe duration depends on the maximum frame rate of the camera. For very fast sensors the max. strobe duration time, dependent on the specification of the LEDs used, cannot be applied in full length, as the recovery time may become too short. The calculation is done automatically depending on the LEDs used and the max. frame rate of the camera in its actual mode of operation. Such calculation also includes boosted frame rates e.g. when the camera is in partial scanning and/or binning mode.

`LvStrobeDurationMode_Free` The maximum strobe duration depends on the maximum allowed ON-time and the minimum required recovery time of the LEDs used. The user can program the strobe duration free, according to his request, but must be aware himself about the relation of strobe ON-time and recovery time. An automatic protection circuit in HW drops a strobe in case the proper relation of ON-time to recovery time is not guaranteed. In such case a related error code is returned by the SW (frame message or otherwise)

Definition at line 6483 of file `sv.synview.enums.h`.

5.30.2.72 enum `LvStrobeEnable`

Enum values for the `LvDevice_LvStrobeEnable` feature.

Enumerator

`LvStrobeEnable_Off` Switches the strobe off.

`LvStrobeEnable_AllClusters` Switches on all LED clusters of the strobe light. On strobe lights possessing just a single LED cluster this cluster is switched on.

`LvStrobeEnable_LEDCluster1` Switches on LED cluster 1 only. The strobe will use just the LEDs in this cluster.

`LvStrobeEnable_LEDCluster2` Switches on LED cluster 2 only. The strobe will use just the LEDs in this cluster.

Definition at line 6461 of file `sv.synview.enums.h`.

5.30.2.73 enum `LvTimerSelector`

Enum values for the `LvDevice_TimerSelector` feature.

Enumerator

`LvTimerSelector_Timer1` Selects timer 1 for configuration.

`LvTimerSelector_Timer2` Selects timer 2 for configuration.

`LvTimerSelector_Timer3` Selects timer 3 for configuration.

`LvTimerSelector_Timer4` Selects timer 4 for configuration.

Definition at line 4743 of file `sv.synview.enums.h`.

5.30.2.74 enum `LvTimerTriggerSource`

Enum values for the `LvDevice_TimerTriggerSource` feature.

Enumerator

`LvTimerTriggerSource_Off` Switches timer trigger signal off - no signal will be firing the timer

- LvTimerTriggerSource_FrameTrigger** Switches timer trigger signal to frame trigger - activation of the frame trigger internal signal (before counting down eventual trigger delay) activates the timer.
- LvTimerTriggerSource_Counter1End** Switches timer trigger signal to counter 1 end - expiration of counter 1 activates the timer.
- LvTimerTriggerSource_Counter2End** Switches timer trigger signal to counter 2 end - expiration of counter 2 activates the timer.
- LvTimerTriggerSource_Counter3End** Switches timer trigger signal to counter 3 end - expiration of counter 3 activates the timer.
- LvTimerTriggerSource_Counter4End** Switches timer trigger signal to counter 4 end - expiration of counter 4 activates the timer.
- LvTimerTriggerSource_UserOutput1** Switches timer trigger signal to user output 1 - activation of user output 1 activates the timer.
- LvTimerTriggerSource_UserOutput2** Switches timer trigger signal to user output 2 - activation of user output 2 activates the timer.
- LvTimerTriggerSource_UserOutput3** Switches timer trigger signal to user output 3 - activation of user output 3 activates the timer.
- LvTimerTriggerSource_UserOutput4** Switches timer trigger signal to user output 4 - activation of user output 4 activates the timer.
- LvTimerTriggerSource_UserOutput5** Switches timer trigger signal to user output 5 - activation of user output 5 activates the timer.
- LvTimerTriggerSource_UserOutput6** Switches timer trigger signal to user output 6 - activation of user output 6 activates the timer.
- LvTimerTriggerSource_UserOutput7** Switches timer trigger signal to user output 7 - activation of user output 7 activates the timer.
- LvTimerTriggerSource_UserOutput8** Switches timer trigger signal to user output 8 - activation of user output 8 activates the timer.

Definition at line 4764 of file sv.synview.enums.h.

5.30.2.75 enum LvTLType

Enum values for the [LvSystem_TLType](#) feature.

Enumerator

- LvTLType_Mixed** GenTL producer supporting mixed technologies.
- LvTLType_Custom** GenTL producer supporting custom technology devices.
- LvTLType_GEV** GenTL producer supporting GigE Vision devices.
- LvTLType_U3V** GenTL producer supporting USB3 Vision devices.
- LvTLType_ICUBE** GenTL producer supporting ICube devices.
- LvTLType_SIM** GenTL producer supporting Sim devices.

Definition at line 5675 of file sv.synview.enums.h.

5.30.2.76 enum LvTriggerActivation

Enum values for the [LvDevice_TriggerActivation](#) feature.

Enumerator

- LvTriggerActivation_RisingEdge** Selects the trigger signal rising edge as active.
- LvTriggerActivation_FallingEdge** Selects the trigger signal falling edge as active

- LvTriggerActivation_AnyEdge*** Selects the trigger signal any edge as active
- LvTriggerActivation_LevelHigh*** Selects the trigger signal high level as active
- LvTriggerActivation_LevelLow*** Selects the trigger signal low level as active

Definition at line 4376 of file sv.synview.enums.h.

5.30.2.77 enum LvTriggerCaching

Enum values for the [LvDevice_LvTriggerCaching](#) feature.

Enumerator

- LvTriggerCaching_Cache*** Trigger caching mode 'cache' - early triggers are cached and applied as soon as possible.
- LvTriggerCaching_Drop*** Trigger caching mode 'cache' - early triggers are dropped

Definition at line 4400 of file sv.synview.enums.h.

5.30.2.78 enum LvTriggerMode

Enum values for the [LvDevice_TriggerMode](#) feature.

Enumerator

- LvTriggerMode_Off*** Trigger mode off - disables selected trigger
- LvTriggerMode_On*** Trigger mode on - enables selected trigger.

Definition at line 4226 of file sv.synview.enums.h.

5.30.2.79 enum LvTriggerSelector

Enum values for the [LvDevice_TriggerSelector](#) feature.

Enumerator

- LvTriggerSelector_FrameStart*** Frame start trigger - controls a new frame acquisition.
- LvTriggerSelector_FrameBurstStart*** Frame burst start trigger - Selects a trigger starting the capture of the bursts of frames.
- LvTriggerSelector_LineStart*** Line start trigger - Selects a trigger starting the capture of one Line of a Frame.
- LvTriggerSelector_VirtualFrameActive*** Virtual frame active trigger - Selects a trigger activating the capture of virtual Frames.

Definition at line 4205 of file sv.synview.enums.h.

5.30.2.80 enum LvTriggerSource

Enum values for the [LvDevice_TriggerSource](#) feature.

Enumerator

- LvTriggerSource_Line1*** Sets the signal source for the selected trigger to line 1 (optocoupler input).
- LvTriggerSource_Line2*** Sets the signal source for the selected trigger to line 2 (optocoupler input).
- LvTriggerSource_Line3*** Sets the signal source for the selected trigger to line 3 (optocoupler input).

- LvTriggerSource_Line4** Sets the signal source for the selected trigger to line 4 (optocoupler input).
- LvTriggerSource_Line5** Sets the signal source for the selected trigger to line 5.
- LvTriggerSource_Line6** Sets the signal source for the selected trigger to line 6.
- LvTriggerSource_Line7** Sets the signal source for the selected trigger to line 7.
- LvTriggerSource_Line8** Sets the signal source for the selected trigger to line 8.
- LvTriggerSource_Line17** Sets the signal source for the selected trigger to line 17 (TTL input).
- LvTriggerSource_Line18** Sets the signal source for the selected trigger to line 18 (TTL input).
- LvTriggerSource_Line19** Sets the signal source for the selected trigger to line 19.
- LvTriggerSource_Line20** Sets the signal source for the selected trigger to line 20.
- LvTriggerSource_Line21** Sets the signal source for the selected trigger to line 21.
- LvTriggerSource_Line22** Sets the signal source for the selected trigger to line 22.
- LvTriggerSource_Line23** Sets the signal source for the selected trigger to line 23.
- LvTriggerSource_Line24** Sets the signal source for the selected trigger to line 24.
- LvTriggerSource_Software** Sets the signal source for the selected trigger to software.
- LvTriggerSource_Action1** Sets the signal source for the selected trigger to action signal 1.
- LvTriggerSource_Action2** Sets the signal source for the selected trigger to action signal 2.
- LvTriggerSource_Action3** Sets the signal source for the selected trigger to action signal 3.
- LvTriggerSource_Action4** Sets the signal source for the selected trigger to action signal 4.
- LvTriggerSource_Action5** Sets the signal source for the selected trigger to action signal 5.
- LvTriggerSource_Action6** Sets the signal source for the selected trigger to action signal 6.
- LvTriggerSource_Action7** Sets the signal source for the selected trigger to action signal 7.
- LvTriggerSource_Action8** Sets the signal source for the selected trigger to action signal 8.
- LvTriggerSource_Quad** Sets the signal source for the selected trigger to quadrature decoder.
- LvTriggerSource_Counter1** Sets the signal source for the selected trigger to counter 1.
- LvTriggerSource_Counter2** Sets the signal source for the selected trigger to counter 2.
- LvTriggerSource_Counter3** Sets the signal source for the selected trigger to counter 3.
- LvTriggerSource_Counter4** Sets the signal source for the selected trigger to counter 4.
- LvTriggerSource_Timer1** Sets the signal source for the selected trigger to timer 1.
- LvTriggerSource_Timer2** Sets the signal source for the selected trigger to timer 2.
- LvTriggerSource_Timer3** Sets the signal source for the selected trigger to timer 3.
- LvTriggerSource_Timer4** Sets the signal source for the selected trigger to timer 4.
- LvTriggerSource_UserOutput1** Sets the signal source for the selected trigger to user output 1.
- LvTriggerSource_UserOutput2** Sets the signal source for the selected trigger to user output 2.
- LvTriggerSource_UserOutput3** Sets the signal source for the selected trigger to user output 3.
- LvTriggerSource_UserOutput4** Sets the signal source for the selected trigger to user output 4.
- LvTriggerSource_UserOutput5** Sets the signal source for the selected trigger to user output 5.
- LvTriggerSource_UserOutput6** Sets the signal source for the selected trigger to user output 6.
- LvTriggerSource_UserOutput7** Sets the signal source for the selected trigger to user output 7.
- LvTriggerSource_UserOutput8** Sets the signal source for the selected trigger to user output 8.

Definition at line 4241 of file sv.synview.enums.h.

5.30.2.81 enum `LvUniBalanceRatioSelector`

Enum values for the `LvDevice_LvUniBalanceRatioSelector` feature.

Enumerator

`LvUniBalanceRatioSelector_Red` Selects the red channel for configuration.

`LvUniBalanceRatioSelector_Green` Selects the green channel for configuration.

`LvUniBalanceRatioSelector_Blue` Selects the blue channel for configuration.

Definition at line 5902 of file `sv.synview.enums.h`.

5.30.2.82 enum `LvUniBalanceWhiteAuto`

Enum values for the `LvDevice_LvUniBalanceWhiteAuto` feature.

Enumerator

`LvUniBalanceWhiteAuto_Off` Automatic white balance mode off - the automatic white balance is not applied.

`LvUniBalanceWhiteAuto_Once` Automatic white balance mode once - the white balance factors are once adjusted, then switches back to off.

Definition at line 5920 of file `sv.synview.enums.h`.

5.30.2.83 enum `LvUniColorTransformationMode`

Enum values for the `LvDevice_LvUniColorTransformationMode` feature.

Enumerator

`LvUniColorTransformationMode_Direct` In this mode the Color Transformation matrix can be controlled directly.

`LvUniColorTransformationMode_Generated` In this mode the Color Transformation matrix is set through the higher level features, such as the Saturation.

Definition at line 6443 of file `sv.synview.enums.h`.

5.30.2.84 enum `LvUniColorTransformationSelector`

Enum values for the `LvDevice_LvUniColorTransformationSelector` feature.

Enumerator

`LvUniColorTransformationSelector_RGBtoRGB` RGB to RGB matrix transformation - currently the only Color Transformation matrix type.

Definition at line 5935 of file `sv.synview.enums.h`.

5.30.2.85 enum `LvUniColorTransformationValueSelector`

Enum values for the `LvDevice_LvUniColorTransformationValueSelector` feature.

Enumerator

`LvUniColorTransformationValueSelector_Gain00` Selects the gain 00 (RR, red-red) entry of the color transformation matrix.

- LvUniColorTransformationValueSelector_Gain01*** Selects the gain 01 (RG, red-green) entry of the color transformation matrix.
- LvUniColorTransformationValueSelector_Gain02*** Selects the gain 02 (RB, red-blue) entry of the color transformation matrix.
- LvUniColorTransformationValueSelector_Gain10*** Selects the gain 10 (GR, green-red) entry of the color transformation matrix.
- LvUniColorTransformationValueSelector_Gain11*** Selects the gain 11 (GG, green-green) entry of the color transformation matrix.
- LvUniColorTransformationValueSelector_Gain12*** Selects the gain 12 (GB, green-blue) entry of the color transformation matrix.
- LvUniColorTransformationValueSelector_Gain20*** Selects the gain 20 (BR, blue-red) entry of the color transformation matrix.
- LvUniColorTransformationValueSelector_Gain21*** Selects the gain 21 (BG, blue-green) entry of the color transformation matrix.
- LvUniColorTransformationValueSelector_Gain22*** Selects the gain 22 (BB, blue-blue) entry of the color transformation matrix.

Definition at line 5947 of file sv.synview.enums.h.

5.30.2.86 enum LvUniLUTMode

Enum values for the [LvDevice_LvUniLUTMode](#) feature.

Enumerator

- LvUniLUTMode_Direct*** In this mode the LUT is controlled directly.
- LvUniLUTMode_Generated*** In this mode the LUT is controlled through the higher level features, such as brightness, contrast, gamma or white balance.

Definition at line 6408 of file sv.synview.enums.h.

5.30.2.87 enum LvUniLUTSelector

Enum values for the [LvDevice_LvUniLUTSelector](#) feature.

Enumerator

- LvUniLUTSelector_Luminance*** Selects the luminance LUT for configuration.
- LvUniLUTSelector_Red*** Selects the red LUT for configuration.
- LvUniLUTSelector_Green*** Selects the green LUT for configuration.
- LvUniLUTSelector_Blue*** Selects the blue LUT for configuration.

Definition at line 6422 of file sv.synview.enums.h.

5.30.2.88 enum LvUniProcessExecution

Enum values for the [LvDevice_LvUniProcessExecution](#) feature.

Enumerator

- LvUniProcessExecution_OnBufferPtrQuery*** The SW image processing is delayed to the time the application asks for the [LvBuffer_UniBase](#) or [LvBuffer_ProcessBase](#) pointer or for the [LvIplmgInfo](#) data. This enables to the application to skip the processing in case it is not needed. If this is queried several times for the same image, the processing is done only once.

LvUniProcessExecution_OnPopFromQueue The SW image processing is done always - at the moment the buffer is popped from the output buffer queue, before delivering it to the application.

LvUniProcessExecution_OnExplicitRequest The SW processing is not done automatically, but must be explicitly done by the ExecProcess command of the Buffer.

Definition at line 6247 of file sv.synview.enums.h.

5.30.2.89 enum LvUniProcessMode

Enum values for the [LvDevice_LvUniProcessMode](#) feature.

Enumerator

LvUniProcessMode_HwOnly HwOnly - The processing is done only in case it is available directly on the hardware (device). The images will be delivered to the output buffer queue already processed.

LvUniProcessMode_SwOnly SwOnly - The processing will be done by software even if the hardware could support the operation. The software processing is done when the buffer is passed to the output buffer queue (or later - see LvUniProcessExecution).

LvUniProcessMode_Auto Auto - The processing will be done by hardware and by software will be processed only the part, which is not possible to do on hardware. Note that if the Bayer decoding is done by software (this happens when you select an undecoded Bayer pixel format as the device PixelFormat), the LUT must be then also done by software, even if it is available in hardware; that's because it must be applied after the Bayer decoding.

LvUniProcessMode_Off Off - The automatic processing is not available. You can use the HW features (LUT etc.) directly.

Definition at line 5844 of file sv.synview.enums.h.

5.30.2.90 enum LvUserOutputSelector

Enum values for the [LvDevice_UserOutputSelector](#) feature.

Enumerator

LvUserOutputSelector_UserOutput1 Selects user output 1.

LvUserOutputSelector_UserOutput2 Selects user output 2.

LvUserOutputSelector_UserOutput3 Selects user output 3.

LvUserOutputSelector_UserOutput4 Selects user output 4.

LvUserOutputSelector_UserOutput5 Selects user output 5.

LvUserOutputSelector_UserOutput6 Selects user output 6.

LvUserOutputSelector_UserOutput7 Selects user output 7.

LvUserOutputSelector_UserOutput8 Selects user output 8.

Definition at line 6213 of file sv.synview.enums.h.

5.30.2.91 enum LvUserSetDefault

Enum values for the [LvDevice_UserSetDefault](#) feature.

Enumerator

LvUserSetDefault_Default Selects the default user set as the default startup set.

LvUserSetDefault_UserSet1 Selects user set 1 as the default startup set.

LvUserSetDefault_UserSet2 Selects user set 2 as the default startup set.

LvUserSetDefault_UserSet3 Selects user set 3 as the default startup set.

LvUserSetDefault_UserSet4 Selects user set 4 as the default startup set.

LvUserSetDefault_None When resetting/connecting the camera, no user set is applied, the last camera configuration remains. During camera boot, the default user set is applied.

Definition at line 5490 of file sv.synview.enums.h.

5.30.2.92 enum LvUserSetDefaultSelector

Enum values for the [LvDevice_UserSetDefaultSelector](#) feature.

Enumerator

LvUserSetDefaultSelector_Default Selects the default user set as the default startup set.

LvUserSetDefaultSelector_UserSet1 Selects user set 1 as the default startup set.

LvUserSetDefaultSelector_UserSet2 Selects user set 2 as the default startup set.

LvUserSetDefaultSelector_UserSet3 Selects user set 3 as the default startup set.

LvUserSetDefaultSelector_UserSet4 Selects user set 4 as the default startup set.

LvUserSetDefaultSelector_None When resetting/connecting the camera, no user set is applied, the last camera configuration remains. During camera boot, the default user set is applied.

Definition at line 5464 of file sv.synview.enums.h.

5.30.2.93 enum LvUserSetSelector

Enum values for the [LvDevice_UserSetSelector](#) feature.

Enumerator

LvUserSetSelector_Default Selects the default configuration set.

LvUserSetSelector_UserSet1 Selects user set 1.

LvUserSetSelector_UserSet2 Selects user set 2.

LvUserSetSelector_UserSet3 Selects user set 3.

LvUserSetSelector_UserSet4 Selects user set 4.

Definition at line 5442 of file sv.synview.enums.h.

5.31 LvStreamStart() flags definitions

Macros

- `#define LvStreamStartFlags_Default`

5.31.1 Detailed Description

5.31.2 Macro Definition Documentation

5.31.2.1 `#define LvStreamStartFlags_Default`

Default stream start flag

Definition at line 21 of file sv.synview.enums.h.

5.32 LvStreamStop() flags definitions

Macros

- `#define LvStreamStopFlags_Default`
- `#define LvStreamStopFlags_Kill`

5.32.1 Detailed Description

5.32.2 Macro Definition Documentation

5.32.2.1 `#define LvStreamStopFlags_Default`

Stop the acquisition engine when the currently running tasks like filling a buffer are completed. This is the default.
Definition at line 32 of file sv.synview.enums.h.

5.32.2.2 `#define LvStreamStopFlags_Kill`

Stop the acquisition engine immediately and leave buffers currently being filled in the Input Buffer Pool.
Definition at line 36 of file sv.synview.enums.h.

5.33 LvDeviceUniSetLut() and LvDeviceUniGetLut() flags definitions

Macros

- `#define LvUniLutFlags_HwLut`

5.33.1 Detailed Description

5.33.2 Macro Definition Documentation

5.33.2.1 `#define LvUniLutFlags_HwLut`

If present, the operation is done directly on HW LUT, passing the UniProcess mechanism.

Definition at line 47 of file sv.synview.enums.h.

5.34 LvSaveFlag definitions

Macros

- `#define LvSaveFlag_RemoteFtr`
- `#define LvSaveFlag_LocalFtr`
- `#define LvSaveFlag_GenTIFtr`
- `#define LvSaveFlag_All`
- `#define LvSaveFlag_IgnoreVersion`
- `#define LvSaveFlag_IgnoreModel`

5.34.1 Detailed Description

5.34.2 Macro Definition Documentation

5.34.2.1 `#define LvSaveFlag_All`

Save/load device all features (combines all flags above).

Definition at line 64 of file sv.synview.enums.h.

5.34.2.2 `#define LvSaveFlag_GenTIFtr`

Save/load device GenTL XML features.

Definition at line 62 of file sv.synview.enums.h.

5.34.2.3 `#define LvSaveFlag_IgnoreModel`

If specified, the remote device model check is not done when reading the file - the file is read even if it was created by different device model (this may lead to errors by some features).

Definition at line 72 of file sv.synview.enums.h.

5.34.2.4 `#define LvSaveFlag_IgnoreVersion`

If specified, the remote device FW version check is not done when reading the file - the file is read even if it was created by device with a different FW version (this may lead to errors by some features).

Definition at line 68 of file sv.synview.enums.h.

5.34.2.5 `#define LvSaveFlag_LocalFtr`

Save/load device local XML features.

Definition at line 60 of file sv.synview.enums.h.

5.34.2.6 `#define LvSaveFlag_RemoteFtr`

Save/load device remote XML features.

Definition at line 58 of file sv.synview.enums.h.

5.35 LvPixelFormat definitions

5.35.1 Detailed Description

5.35.2 Macro Definition Documentation

5.35.2.1 #define LV_PIX_COLOR

PixelFormat component: The pixel format is color.

Definition at line 3855 of file sv.synview.enums.h.

5.35.2.2 #define LV_PIX_COLOR_MASK

Mask for the color flag

Definition at line 3857 of file sv.synview.enums.h.

5.35.2.3 #define LV_PIX_CUSTOM

PixelFormat component: The pixel format is custom.

Definition at line 3856 of file sv.synview.enums.h.

5.35.2.4 #define LV_PIX_EFFECTIVE_PIXEL_SIZE_MASK

Mask for the pixel size part.

Definition at line 3867 of file sv.synview.enums.h.

5.35.2.5 #define LV_PIX_EFFECTIVE_PIXEL_SIZE_SHIFT

Shift for the pixel size part.

Definition at line 3868 of file sv.synview.enums.h.

5.35.2.6 #define LV_PIX_MONO

PixelFormat component: The pixel format is monochrome.

Definition at line 3854 of file sv.synview.enums.h.

5.35.2.7 #define LV_PIX_OCCUPY12BIT

PixelFormat component: One pixel occupies 12 bits.

Definition at line 3861 of file sv.synview.enums.h.

5.35.2.8 #define LV_PIX_OCCUPY16BIT

PixelFormat component: One pixel occupies 16 bits.

Definition at line 3862 of file sv.synview.enums.h.

5.35.2.9 #define LV_PIX_OCCUPY24BIT

PixelFormat component: One pixel occupies 24 bits.

Definition at line 3863 of file sv.synview.enums.h.

5.35.2.10 #define LV_PIX_OCCUPY32BIT

PixelFormat component: One pixel occupies 32 bits.

Definition at line 3864 of file sv.synview.enums.h.

5.35.2.11 #define LV_PIX_OCCUPY36BIT

PixelFormat component: One pixel occupies 36 bits.

Definition at line 3865 of file sv.synview.enums.h.

5.35.2.12 #define LV_PIX_OCCUPY48BIT

PixelFormat component: One pixel occupies 48 bits.

Definition at line 3866 of file sv.synview.enums.h.

5.35.2.13 #define LV_PIX_OCCUPY8BIT

PixelFormat component: One pixel occupies 8 bits.

Definition at line 3860 of file sv.synview.enums.h.

5.35.2.14 #define LvPixelFormat_BGR10Packed

Alias for [LvPixelFormat_BGR10](#).

Definition at line 3877 of file sv.synview.enums.h.

5.35.2.15 #define LvPixelFormat_BGR12Packed

Alias for [LvPixelFormat_BGR12](#).

Definition at line 3879 of file sv.synview.enums.h.

5.35.2.16 #define LvPixelFormat_BGR16Packed

Alias for [LvPixelFormat_BGR16](#).

Definition at line 3881 of file sv.synview.enums.h.

5.35.2.17 #define LvPixelFormat_BGR555p

Alias for [LvPixelFormat_BGR555P](#).

Definition at line 3901 of file sv.synview.enums.h.

5.35.2.18 #define LvPixelFormat_BGR565p

Alias for [LvPixelFormat_BGR565P](#).

Definition at line 3899 of file sv.synview.enums.h.

5.35.2.19 `#define LvPixelFormat_BGR565Packed`

Alias for [LvPixelFormat_BGR565P](#).

Definition at line 3884 of file sv.synview.enums.h.

5.35.2.20 `#define LvPixelFormat_BGR8Packed`

Alias for [LvPixelFormat_BGR8](#).

Definition at line 3873 of file sv.synview.enums.h.

5.35.2.21 `#define LvPixelFormat_BGRa8`

Alias for [LvPixelFormat_BGRA8](#).

Definition at line 3897 of file sv.synview.enums.h.

5.35.2.22 `#define LvPixelFormat_BGRA8Packed`

Alias for [LvPixelFormat_BGRA8](#).

Definition at line 3875 of file sv.synview.enums.h.

5.36 Image Processing Library functions

Modules

- [Common functions](#)
- [Image initialization functions](#)
- [Region of Interest \(ROI\) functions](#)
- [Lookup Table \(LUT\) functions](#)
- [Bayer decoding/encoding functions](#)
- [Rotation and line manipulation functions](#)
- [Pixel format conversion functions](#)
- [Saving/loading functions](#)
- [Overlay functions](#)
- [RGB color correction and convolution functions](#)
- [Shading correction functions](#)

5.36.1 Detailed Description

5.37 Common functions

Functions

- LV_EXTC LV_DLLIMPORT void [LvipGetStatusMsg](#) ([LvStatus](#) TlStatus, char *pMsg, size_t MsgBufSize)

5.37.1 Detailed Description

5.37.2 Function Documentation

5.37.2.1 LV_EXTC LV_DLLIMPORT void LvipGetStatusMsg (LvStatus TlStatus, char * pMsg, size_t MsgBufSize)

Retrieves a text describing the status.

Parameters

<i>TlStatus</i>	Error status code.
<i>pMsg</i>	Pointer to buffer for the error message.
<i>MsgBufSize</i>	Size of the buffer.

5.38 Image initialization functions

Functions

- LV_EXTC LV_DLLIMPORT LvStatus LvIpInitImgInfo (LvIpImgInfo *pImgInfo, uint32_t Width, uint32_t Height, uint32_t PixelFormat, uint32_t Attributes)
- LV_EXTC LV_DLLIMPORT uint32_t LvIpGetImageDataSize (LvIpImgInfo *pImgInfo)
- LV_EXTC LV_DLLIMPORT LvStatus LvIpAllocateImageData (LvIpImgInfo *pImgInfo)
- LV_EXTC LV_DLLIMPORT LvStatus LvIpDeallocateImageData (LvIpImgInfo *pImgInfo)
- LV_EXTC LV_DLLIMPORT LvStatus LvIpFillWithColor (LvIpImgInfo *pImgInfo, uint8_t Red, uint8_t Green, uint8_t Blue, uint32_t Options)

5.38.1 Detailed Description

5.38.2 Function Documentation

5.38.2.1 LV_EXTC LV_DLLIMPORT LvStatus LvIpAllocateImageData (LvIpImgInfo * pImgInfo)

Allocates appropriate space to pData or color planes, according to the Height and LineIncrement.

Parameters

<i>pImgInfo</i>	pointer to the LvIpImgInfo of the image.
-----------------	--

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.38.2.2 LV_EXTC LV_DLLIMPORT LvStatus LvIpDeallocateImageData (LvIpImgInfo * pImgInfo)

Deallocates the image data buffer(s) If the flags is not containing [LvIpImgAttr_NotDataOwner](#), deallocates pData or color planes and sets them to NULL.

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.38.2.3 LV_EXTC LV_DLLIMPORT LvStatus LvIpFillWithColor (LvIpImgInfo * pImgInfo, uint8_t Red, uint8_t Green, uint8_t Blue, uint32_t Options)

Fills image data with specified color.

Parameters

<i>pImgInfo</i>	pointer to LvIpImgInfo structure, the data of which has to be filled with the selected color
<i>Red</i>	8bit Red value
<i>Green</i>	8bit Green value
<i>Blue</i>	8bit Blue value
<i>Options</i>	Options reserved - should be set to 0.

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.38.2.4 LV_EXTC LV_DLLIMPORT uint32_t LvipGetImageDataSize (LvipImgInfo * *plmgInfo*)

Returns the data size required for the image. Expects the Height and LineIncrement are already calculated. In case of color planes returns the size of one plane

Parameters

<i>plmgInfo</i>	pointer to the LvplmgInfo of the image.
-----------------	---

Returns

The data size required for the image in bytes.

5.38.2.5 LV_EXTC LV_DLLIMPORT LvStatus LvplnItmgInfo ([LvplmgInfo](#) * *plmgInfo*, uint32_t *Width*, uint32_t *Height*, uint32_t *PixelFormat*, uint32_t *Attributes*)

Initializes the [LvplmgInfo](#) to specified values, calculates the line increment and sets pData to NULL (be sure to deallocate the image buffers if were allocated, before this function call). If pData of other owner is used, set the [LvplmgAttr_NotDataOwner](#) flag so that the data are not deallocated when [LvIpDeallocatImageData\(\)](#) is applied to this [ImgInfo](#).

Parameters

<i>plmgInfo</i>	Pointer to LvplmgInfo structure which is to be initialized
<i>Width</i>	Width of image in pixels
<i>Height</i>	Height of image in pixels
<i>PixelFormat</i>	Pixel format; one of the LvPixelFormat .
<i>Attributes</i>	Image attributes; OR-ed combination of the LvplmgAttr .

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.39 Region of Interest (ROI) functions

Functions

- LV_EXTC LV_DLLIMPORT LvStatus LvipCopyArea (LvimgInfo *pSrcImgInfo, LvimgInfo *pDstImgInfo, int32_t DstXOffset, int32_t DstYOffset, uint32_t DstWidth, uint32_t DstHeight, uint32_t Options)

5.39.1 Detailed Description

5.39.2 Function Documentation

5.39.2.1 LV_EXTC LV_DLLIMPORT LvStatus LvipCopyArea (LvimgInfo * pSrcImgInfo, LvimgInfo * pDstImgInfo, int32_t DstXOffset, int32_t DstYOffset, uint32_t DstWidth, uint32_t DstHeight, uint32_t Options)

Extracts from the source bitmap a rectangle as destination bitmap. If the rectangle goes outside of the source image, the intersection rectangle is taken, that means the result width and/or height can be smaller than required.

If the intersection is zero, the function returns LVSTATUS_LVIP_DST_RECT_OUTSIDE_SRC.

- Supported input pixel formats: 8-bit mono, 15-bit BGR, 16-bit BGR, 24-bit BGR, 32-bit BGR.
- Supported output pixel formats: equal to the input pixel format.
- Can be done in-place: No.

Parameters

<i>pSrcImgInfo</i>	Source image info
<i>pDstImgInfo</i>	Destination image info
<i>DstXOffset</i>	Left offset of the rectangle
<i>DstYOffset</i>	Upper offset of the rectangle
<i>DstWidth</i>	Width of area which has to be copied
<i>DstHeight</i>	Height of area which has to be copied
<i>Options</i>	Options - OR-ed combination of LvipOption . If the LvipOption_ReallocateDst is used, then also can contain attributes from LvimgAttr for (re)allocated image.

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.40 Lookup Table (LUT) functions

Functions

- LV_EXTC LV_DLLIMPORT LvStatus LvipAllocateLut (uint32_t LutType)
- LV_EXTC LV_DLLIMPORT LvStatus LvipFreeLut (LvipHLut hLut)
- LV_EXTC LV_DLLIMPORT LvStatus LvipResetLut (LvipHLut hLut)
- LV_EXTC LV_DLLIMPORT LvStatus LvipSet8BitLut (LvipHLut hLut, uint8_t *pRed, uint8_t *pGreen, uint8_t *pBlue)
- LV_EXTC LV_DLLIMPORT LvStatus LvipGet8BitLut (LvipHLut hLut, uint8_t *pRed, uint8_t *pGreen, uint8_t *pBlue)
- LV_EXTC LV_DLLIMPORT LvStatus LvipSet10BitLut (LvipHLut hLut, uint16_t *pRed, uint16_t *pGreen, uint16_t *pBlue)
- LV_EXTC LV_DLLIMPORT LvStatus LvipGet10BitLut (LvipHLut hLut, uint16_t *pRed, uint16_t *pGreen, uint16_t *pBlue)
- LV_EXTC LV_DLLIMPORT LvStatus LvipSet12BitLut (LvipHLut hLut, uint16_t *pRed, uint16_t *pGreen, uint16_t *pBlue)
- LV_EXTC LV_DLLIMPORT LvStatus LvipGet12BitLut (LvipHLut hLut, uint16_t *pRed, uint16_t *pGreen, uint16_t *pBlue)
- LV_EXTC LV_DLLIMPORT LvStatus LvipSet8BitLutValue (LvipHLut hLut, LvEnum LutSelector, uint32_t Index, uint8_t Value)
- LV_EXTC LV_DLLIMPORT LvStatus LvipGet8BitLutValue (LvipHLut hLut, LvEnum LutSelector, uint32_t Index, uint8_t *pValue)
- LV_EXTC LV_DLLIMPORT LvStatus LvipSet10BitLutValue (LvipHLut hLut, LvEnum LutSelector, uint32_t Index, uint16_t Value)
- LV_EXTC LV_DLLIMPORT LvStatus LvipGet10BitLutValue (LvipHLut hLut, LvEnum LutSelector, uint32_t Index, uint16_t *pValue)
- LV_EXTC LV_DLLIMPORT LvStatus LvipSet12BitLutValue (LvipHLut hLut, LvEnum LutSelector, uint32_t Index, uint16_t Value)
- LV_EXTC LV_DLLIMPORT LvStatus LvipGet12BitLutValue (LvipHLut hLut, LvEnum LutSelector, uint32_t Index, uint16_t *pValue)
- LV_EXTC LV_DLLIMPORT LvStatus LvipAddGammaToLut (uint32_t Gamma, LvipHLut hLut)
- LV_EXTC LV_DLLIMPORT LvStatus LvipAddWbToLut (uint32_t FactorRed, uint32_t FactorGreen, uint32_t FactorBlue, LvipHLut hLut)
- LV_EXTC LV_DLLIMPORT LvStatus LvipAddOffsetAndGainToLut (int32_t Offset, int32_t Gain, LvipHLut hLut)
- LV_EXTC LV_DLLIMPORT LvStatus LvipAddBrightnessAndContrastToLut (int32_t Brightness, int32_t Contrast, LvipHLut hLut)
- LV_EXTC LV_DLLIMPORT LvStatus LvipApplyLut (LvIpImgInfo *pSrcImgInfo, LvIpImgInfo *pDstImgInfo, LvipHLut hLut, uint32_t Options)
- LV_EXTC LV_DLLIMPORT LvStatus LvipCalcWbFactors (LvIpImgInfo *pSrcImgInfo, uint32_t *pFactorRed, uint32_t *pFactorGreen, uint32_t *pFactorBlue, uint32_t Options)

5.40.1 Detailed Description

5.40.2 Function Documentation

5.40.2.1 LV_EXTC LV_DLLIMPORT LvStatus LvipAddBrightnessAndContrastToLut (int32_t *Brightness*, int32_t *Contrast*, LvipHLut *hLut*)

Adds brightness and contrast to LUT. Recalculates each value in the LUT table by adding the brightness and multiplying by contrast. This function is similar to the [LvipAddOffsetAndGainToLut\(\)](#) function, with the following 2 differences:

- The Brightness middle value is 1000, meaning no change. The Brightness 0 means black image and 2000 means fully white image, because subtracting or adding the 1000 means subtracting or adding the maximum pixel value.
- The Brightness factor is internally corrected in dependence on contrast. The Contrast is equivalent to Gain in the [LvipAddOffsetAndGainToLut\(\)](#) function. It is a factor multiplied by 1000, i.e. 1000 means 1.0 = no change. Can be also negative - 1000 makes inversion.

Parameters

<i>Brightness</i>	The Brightness to be added expressed in 1/1000 of the maximum pixel value. See the explanation above.
<i>Contrast</i>	The Contrast factor multiplied by 1000.
<i>hLut</i>	Handle to the LUT.

Returns

LVSTATUS_OK in case of success, or error status in case of failure.

5.40.2.2 LV_EXTC LV_DLLIMPORT LvStatus LvipAddGammaToLut (uint32_t Gamma, LvipHLut hLut)

Adds gamma to LUT. Recalculates each value in the LUT table by applying the Gamma curve. Gamma is supplied multiplied by 1000, i.e. for gamma = 1.0 the passed value will be 1000. There is a possibility to do image lighter/darker using different gamma value. This gamma will be added to LUT and when the image is being transformed using any of function, add this LUT to this function as the last parameter.

Note

There is a need to have LUT - see [LvipAllocateLut\(\)](#) and its company.

Parameters

<i>Gamma</i>	Minimal gamma value is 10 - it means that there is a need to enter gamma multiplies by 1000
<i>hLut</i>	Handle to LUT

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.40.2.3 LV_EXTC LV_DLLIMPORT LvStatus LvipAddOffsetAndGainToLut (int32_t Offset, int32_t Gain, LvipHLut hLut)

Adds offset and gain to LUT. Recalculates each value in the LUT table by adding the offset and multiplying by gain. The offset is in range -1000 to +1000, where 0 means no change and 1000 the maximum pixel value - adding 1000 will make the image fully white, adding -1000 will make it fully black. The offset is corresponding to Brightness - 1000, see [LvipAddBrightnessAndContrastToLut\(\)](#).

The gain is the gain factor multiplied by 1000, i.e. 1000 means 1.0 = no change. Can be also negative - 1000 makes inversion. It is equivalent to contrast.

Parameters

<i>Offset</i>	The Offset to be added expressed in 1/1000 of the maximum pixel value. See the explanation above.
---------------	---

<i>Gain</i>	The Gain factor multiplied by 1000.
<i>hLut</i>	Handle to the LUT

Returns

LVSTATUS_OK in case of success, or error status in case of failure.

5.40.2.4 LV_EXTC LV_DLLIMPORT LvStatus LvipAddWbToLut (uint32_t *FactorRed*, uint32_t *FactorGreen*, uint32_t *FactorBlue*, LvipHLut *hLut*)

Adds white balance to LUT. Recalculates each value in the LUT table by applying the white balance factors. The factors are supplied multiplied by 1000, i.e. for the factor = 1.0 the passed value will be 1000. See [LvipCalcWbFactors\(\)](#) for obtaining the WB factors from an image.

Parameters

<i>FactorRed</i>	Red factor of white balance, multiplied by 1000
<i>FactorGreen</i>	Green factor of white balance, multiplied by 1000
<i>FactorBlue</i>	Blue factor of white balance, multiplied by 1000
<i>hLut</i>	Handle to the LUT

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.40.2.5 LV_EXTC LV_DLLIMPORT LvipHLut LvipAllocateLut (uint32_t *LutType*)

Allocates the LUT.

Parameters

<i>LutType</i>	type of LUT which has to be allocated. One of LvipLutType , this value could be optionally OR-ed with the LVIP_LUT_BAYER flag
----------------	---

Returns

handle to the allocated LUT

Note

LUT has to be freed up before end using [LvipFreeLut\(\)](#) function

5.40.2.6 LV_EXTC LV_DLLIMPORT LvStatus LvipApplyLut (LvipImgInfo * *pSrcImgInfo*, LvipImgInfo * *pDstImgInfo*, LvipHLut *hLut*, uint32_t *Options*)

Apply LUT to source image and save it in the destination image. Applies the LUT to the image. Note that the LUT can be applied in other functions as well, which is faster than this separate processing.

Supported input pixel formats: 8-bit mono, 10-bit mono, 12-bit mono, 24-bit BGR, 32-bit BGR, 24-bit RGB, 32-bit RGB. Supported output pixel formats: equal to the input pixel format. Can be done in-place: Yes (DstImgInfo can be NULL).

Parameters

<i>pSrcImgInfo</i>	Source image info
<i>pDstImgInfo</i>	Destination image info
<i>hLut</i>	Handle to the LUT, which has to be applied
<i>Options</i>	Options - OR-ed combination of LvIpOption . If the LvIpOption_ReallocateDst is used, then also can contain attributes from LvIpImgAttr for (re)allocated image.

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.40.2.7 LV_EXTC LV_DLLIMPORT LvStatus LvIpCalcWbFactors (LvIpImgInfo * pSrcImgInfo, uint32_t * pFactorRed, uint32_t * pFactorGreen, uint32_t * pFactorBlue, uint32_t Options)

Calculates white balance factors. The image is expected to be obtained from camera pointed at a neutral grey area. The factor is a gain applied to each pixel component. The gain = 1.0 means no change. In order to avoid using float numbers, the factors are multiplied by 1000 and stored in uint32_t. If the image pixel format is MONO, the image is expected to be Bayer Array encoded.

The factors are normalized, so that all are ≥ 1.0 . This assures the areas with saturated colors remain white. The obtained factors could be used in the [LvIpAddWbToLut\(\)](#) function.

Note

If the [LvIpOption_WbCorrectFactors](#) flag is used, it is assumed that the white balance is calculated from the image to which were applied white balancing factors passed as parameters. Thus only a correction is calculated and the existing factors are modified. This flag cannot be used on undecoded Bayer array image.

Parameters

<i>pSrcImgInfo</i>	Source image info from which the white balance has to be calculated
<i>pFactorRed</i>	Pointer to uint32_t variable to which will be saved the Red factor, multiplied by 1000. If the LvIpOption_WbCorrectFactors flag is used, the variable should contain the factor already used for WB of the current image.
<i>pFactorGreen</i>	Pointer to uint32_t variable to which will be saved the Green factor, multiplied by 1000. If the LvIpOption_WbCorrectFactors flag is used, the variable should contain the factor already used for WB of the current image.
<i>pFactorBlue</i>	Pointer to uint32_t variable to which will be saved the Blue factor, multiplied by 1000. If the LvIpOption_WbCorrectFactors flag is used, the variable should contain the factor already used for WB of the current image.
<i>Options</i>	Options, see LvIpOption_WbCorrectFactors

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.40.2.8 LV_EXTC LV_DLLIMPORT LvStatus LvIpFreeLut (LvIpHLut hLut)

Deallocates the LUT.

Parameters

<i>hLut</i>	Handle to LUT (which had been allocated by the LvipAllocateLut() function)
-------------	--

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.40.2.9 LV_EXTC LV_DLLIMPORT LvStatus LvipGet10BitLut (LvipHLut *hLut*, uint16_t * *pRed*, uint16_t * *pGreen*, uint16_t * *pBlue*)

Gets 10-bit LUT data. This function fills up supplied arrays with the current LUT data. It is useful for example after calling [LvipAddGammaToLut\(\)](#) or [LvipAddWbToLut\(\)](#) to get the values of current LUT.

Parameters

<i>hLut</i>	Handle to LUT
<i>pRed</i>	pointer to an array of 1024 uint16_t values, will be filled with red
<i>pGreen</i>	pointer to an array of 1024 uint16_t values, will be filled with green
<i>pBlue</i>	pointer to an array of 1024 uint16_t values, will be filled with blue

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.40.2.10 LV_EXTC LV_DLLIMPORT LvStatus LvipGet10BitLutValue (LvipHLut *hLut*, LvEnum *LutSelector*, uint32_t *Index*, uint16_t * *pValue*)

Gets 10-bit LUT value. This function reads one value from the LUT. Note that for reading the whole LUT a more effective function [LvipGet10BitLut\(\)](#) is available.

Parameters

<i>hLut</i>	Handle to LUT
<i>LutSelector</i>	LUT selector (see LvLUTSelector). The Luminance LUT is actually stored in the Green one.
<i>Index</i>	Value index in the LUT
<i>pValue</i>	Pointer to the variable which receives the value

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.40.2.11 LV_EXTC LV_DLLIMPORT LvStatus LvipGet12BitLut (LvipHLut *hLut*, uint16_t * *pRed*, uint16_t * *pGreen*, uint16_t * *pBlue*)

Gets 12-bit LUT data. This function fills up supplied arrays with the current LUT data. It is useful for example after calling [LvipAddGammaToLut\(\)](#) or [LvipAddWbToLut\(\)](#) to get the values of current LUT.

Parameters

<i>hLut</i>	Handle to LUT
<i>pRed</i>	pointer to an array of 4096 uint16_t values, will be filled with red
<i>pGreen</i>	pointer to an array of 4096 uint16_t values, will be filled with green

<i>pBlue</i>	pointer to an array of 4096 uint16_t values, will be filled with blue
--------------	---

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.40.2.12 LV_EXTC LV_DLLIMPORT LvStatus LvipGet12BitLutValue (LvipHLut *hLut*, LvEnum *LutSelector*, uint32_t *Index*, uint16_t * *pValue*)

Gets 12-bit LUT value. This function reads one value from the LUT. Note that for reading the whole LUT a more effective function [LvipGet12BitLut\(\)](#) is available.

Parameters

<i>hLut</i>	Handle to LUT
<i>LutSelector</i>	LUT selector (see LvLUTSelector). The Luminance LUT is actually stored in the Green one.
<i>Index</i>	Value index in the LUT
<i>pValue</i>	Pointer to the variable which receives the value

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.40.2.13 LV_EXTC LV_DLLIMPORT LvStatus LvipGet8BitLut (LvipHLut *hLut*, uint8_t * *pRed*, uint8_t * *pGreen*, uint8_t * *pBlue*)

Gets 8-bit LUT data. This function fills up supplied arrays with the current LUT data. It is useful for example after calling [LvipAddGammaToLut\(\)](#) or [LvipAddWbToLut\(\)](#) to get the values of current LUT.

Parameters

<i>hLut</i>	Handle to LUT
<i>pRed</i>	pointer to an array of 256 uint8_t values, which will be filled with the Red LUT values
<i>pGreen</i>	pointer to an array of 256 uint8_t values, which will be filled with the Green LUT values
<i>pBlue</i>	pointer to an array of 256 uint8_t values, will be filled with the LUT values

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.40.2.14 LV_EXTC LV_DLLIMPORT LvStatus LvipGet8BitLutValue (LvipHLut *hLut*, LvEnum *LutSelector*, uint32_t *Index*, uint8_t * *pValue*)

Gets one 8-bit LUT value. This function reads one value from the LUT. Note that for reading the whole LUT a more effective function [LvipGet8BitLut\(\)](#) is available.

Parameters

<i>hLut</i>	Handle to LUT
<i>LutSelector</i>	LUT selector (see LvLUTSelector). The Luminance LUT is actually stored in the Green one.
<i>Index</i>	Value index in the LUT

<i>pValue</i>	Pointer to the variable which receives the value
---------------	--

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.40.2.15 LV_EXTC LV_DLLIMPORT LvStatus LvipResetLut (LvipHLut hLut)

Resets the LUT data to the linear order.

Parameters

<i>hLut</i>	Handle to LUT allocated using the LvipAllocateLut() function
-------------	--

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.40.2.16 LV_EXTC LV_DLLIMPORT LvStatus LvipSet10BitLut (LvipHLut hLut, uint16_t * pRed, uint16_t * pGreen, uint16_t * pBlue)

Sets up 10-bit LUT data. Sets the LUT from 3 arrays of 1024 uint16_t values with 10-bit values. For processing the monochrome images only the green is used.

Parameters

<i>hLut</i>	Handle to LUT
<i>pRed</i>	pointer to an array of 1024 uint16_t red LUT values
<i>pGreen</i>	pointer to an array of 1024 uint16_t green LUT values
<i>pBlue</i>	pointer to an array of 1024 uint16_t blue LUT values

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.40.2.17 LV_EXTC LV_DLLIMPORT LvStatus LvipSet10BitLutValue (LvipHLut hLut, LvEnum LutSelector, uint32_t Index, uint16_t Value)

Sets one 10-bit LUT value. This function writes one value to the LUT. Note that for writing the whole LUT a more effective function [LvipSet10BitLut\(\)](#) is available.

Parameters

<i>hLut</i>	Handle to LUT
<i>LutSelector</i>	LUT selector (see LvLUTSelector). The Luminance LUT is actually stored in the Green one.
<i>Index</i>	Value index in the LUT.
<i>Value</i>	The value.

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.40.2.18 LV_EXTC LV_DLLIMPORT LvStatus LvipSet12BitLut (LvipHLut hLut, uint16_t * pRed, uint16_t * pGreen, uint16_t * pBlue)

Sets up 12-bit LUT data. Sets the LUT from 3 arrays of 4096 uint16_t values with 12-bit values. For processing the monochrome images only the green is used.

Parameters

<i>hLut</i>	Handle to LUT
<i>pRed</i>	pointer to an array of 4096 uint16_t red LUT values
<i>pGreen</i>	pointer to an array of 4096 uint16_t green LUT values
<i>pBlue</i>	pointer to an array of 4096 uint16_t blue LUT values

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.40.2.19 LV_EXTC LV_DLLIMPORT LvStatus LvipSet12BitLutValue (LvipHLut *hLut*, LvEnum *LutSelector*, uint32_t *Index*, uint16_t *Value*)

Sets one 12-bit LUT value. This function writes one value to the LUT. Note that for writing the whole LUT a more effective function [LvipSet12BitLut\(\)](#) is available.

Parameters

<i>hLut</i>	Handle to LUT
<i>LutSelector</i>	LUT selector (see LvLUTSelector). The Luminance LUT is actually stored in the Green one.
<i>Index</i>	Value index in the LUT.
<i>Value</i>	The value.

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.40.2.20 LV_EXTC LV_DLLIMPORT LvStatus LvipSet8BitLut (LvipHLut *hLut*, uint8_t * *pRed*, uint8_t * *pGreen*, uint8_t * *pBlue*)

Sets up the 8-bit LUT data. Sets the LUT from 3 arrays of 256 uint8_t values. For processing the monochrome images only the green is used.

Parameters

<i>hLut</i>	Handle to LUT
<i>pRed</i>	pointer to an array of 256 uint8_t values with red LUT values
<i>pGreen</i>	pointer to an array of 256 uint8_t values with green LUT values
<i>pBlue</i>	pointer to an array of 256 uint8_t values with blue LUT values

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.40.2.21 LV_EXTC LV_DLLIMPORT LvStatus LvipSet8BitLutValue (LvipHLut *hLut*, LvEnum *LutSelector*, uint32_t *Index*, uint8_t *Value*)

Sets one 8-bit LUT value. This function writes one value to the LUT. Note that for writing the whole LUT a more effective function [LvipSet8BitLut\(\)](#) is available.

Parameters

<i>hLut</i>	Handle to LUT
<i>LutSelector</i>	LUT selector (see LvLUTSelector). The Luminance LUT is actually stored in the Green one.
<i>Index</i>	Value index in the LUT.
<i>Value</i>	The value.

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.41 Bayer decoding/encoding functions

Functions

- LV_EXTC LV_DLLIMPORT [LvStatus LvipBdShowMosaic](#) ([LvimgInfo](#) *pSrcImgInfo, [LvimgInfo](#) *pDstImgInfo, uint32_t DstPixelFormat, uint32_t Options)
- LV_EXTC LV_DLLIMPORT [LvStatus LvipBdGreenToGreyscale](#) ([LvimgInfo](#) *pSrcImgInfo, [LvimgInfo](#) *pDstImgInfo, uint32_t DstPixelFormat, uint32_t Options)
- LV_EXTC LV_DLLIMPORT [LvStatus LvipBdNearestNeighbour](#) ([LvimgInfo](#) *pSrcImgInfo, [LvimgInfo](#) *pDstImgInfo, uint32_t DstPixelFormat, uint32_t Options, [LvipHLut](#) hLut)
- LV_EXTC LV_DLLIMPORT [LvStatus LvipBdBilinearInterpolation](#) ([LvimgInfo](#) *pSrcImgInfo, [LvimgInfo](#) *pDstImgInfo, uint32_t DstPixelFormat, uint32_t Options, [LvipHLut](#) hLut)
- LV_EXTC LV_DLLIMPORT [LvStatus LvipBdBilinearColorCorrection](#) ([LvimgInfo](#) *pSrcImgInfo, [LvimgInfo](#) *pDstImgInfo, uint32_t DstPixelFormat, uint32_t Options)
- LV_EXTC LV_DLLIMPORT [LvStatus LvipBdVariableGradients](#) ([LvimgInfo](#) *pSrcImgInfo, [LvimgInfo](#) *pDstImgInfo, uint32_t DstPixelFormat, uint32_t Options, [LvipHLut](#) hLut)
- LV_EXTC LV_DLLIMPORT [LvStatus LvipBdPixelGrouping](#) ([LvimgInfo](#) *pSrcImgInfo, [LvimgInfo](#) *pDstImgInfo, uint32_t DstPixelFormat, uint32_t Options)
- LV_EXTC LV_DLLIMPORT [LvStatus LvipBdEncodeToBayer](#) ([LvimgInfo](#) *pSrcImgInfo, [LvimgInfo](#) *pDstImgInfo, uint32_t DstPixelFormat, uint32_t Options)

5.41.1 Detailed Description

5.41.2 Function Documentation

5.41.2.1 LV_EXTC LV_DLLIMPORT [LvStatus LvipBdBilinearColorCorrection](#) ([LvimgInfo](#) * *pSrcImgInfo*, [LvimgInfo](#) * *pDstImgInfo*, uint32_t *DstPixelFormat*, uint32_t *Options*)

Bayer Decoding: The Bilinear interpolation with Linear Color Correction method The interpolation with Linear Color Correction (LCC) is another adaptive algorithm and optimized for images with edges in horizontal and vertical direction.

Note

This function does not support LUT due to the 2-pass algorithm

Parameters

<i>pSrcImgInfo</i>	Pointer to source image info
<i>pDstImgInfo</i>	Pointer to destination image info
<i>DstPixelFormat</i>	to which LvPixelFormat has to be image converted
<i>Options</i>	Options - OR-ed combination of LvipOption . If the LvipOption_ReallocateDst is used, then also can contain attributes from LvimgAttr for (re)allocated image.

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.41.2.2 LV_EXTC LV_DLLIMPORT [LvStatus LvipBdBilinearInterpolation](#) ([LvimgInfo](#) * *pSrcImgInfo*, [LvimgInfo](#) * *pDstImgInfo*, uint32_t *DstPixelFormat*, uint32_t *Options*, [LvipHLut](#) *hLut*)

Bayer Decoding: The Bilinear Interpolation method The most commonly used method for fast Bayer decoding. For the color not directly available for the given pixel makes the linear interpolation between the 2 or 4 neighbouring pixels to get it. Gives good results with a high speed.

- Supported input pixel formats: 8-bit mono.

- Supported output pixel formats: 8-bit mono, 24-bit BGR, 32-bit BGR.
- Can be done in-place: No.

Parameters

<i>pSrcImgInfo</i>	Bayer encoded source image info
<i>pDstImgInfo</i>	Destination image info
<i>DstPixelFormat</i>	To which LvPixelFormat
<i>Options</i>	Options - OR-ed combination of LvipOption . If the LvipOption_ReallocateDst is used, then also can contain attributes from LvIpImgAttr for (re)allocated image.
<i>hLut</i>	Handle to LUT

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.41.2.3 `LV_EXTC LV_DLLIMPORT LvStatus LvIpBdEncodeToBayer (LvIpImgInfo * pSrcImgInfo, LvIpImgInfo * pDstImgInfo, uint32_t DstPixelFormat, uint32_t Options)`

This function encode an RGB image back to a Bayer encoded image. This function is generally for testing purposes.

Parameters

<i>pSrcImgInfo</i>	RGB source image info
<i>pDstImgInfo</i>	It will contain bayer encoded image
<i>DstPixelFormat</i>	To which LvPixelFormat convert
<i>Options</i>	Options - OR-ed combination of LvipOption . If the LvipOption_ReallocateDst is used, then also can contain attributes from LvIpImgAttr for (re)allocated image.

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.41.2.4 `LV_EXTC LV_DLLIMPORT LvStatus LvIpBdGreenToGreyscale (LvIpImgInfo * pSrcImgInfo, LvIpImgInfo * pDstImgInfo, uint32_t DstPixelFormat, uint32_t Options)`

Bayer Decoding: Convert green to greyscale Converts fast but roughly the Bayer encoded image to a greyscale by using only the green pixels, which cover the half of all pixels. The other half is calculated by bilinear interpolation.

- Supported input pixel formats: 8-bit mono.
- Supported output pixel formats: 8-bit mono.
- Can be done in-place: No.

Parameters

<i>pSrcImgInfo</i>	source image info
<i>pDstImgInfo</i>	destination image info
<i>DstPixelFormat</i>	destination LvPixelFormat
<i>Options</i>	Options - OR-ed combination of LvipOption . If the LvipOption_ReallocateDst is used, then also can contain attributes from LvIpImgAttr for (re)allocated image.

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.41.2.5 LV_EXTC LV_DLLIMPORT LvStatus LvipBdNearestNeighbour (LvipImgInfo * pSrcImgInfo, LvipImgInfo * pDstImgInfo, uint32_t DstPixelFormat, uint32_t Options, LvipHLut hLut)

Bayer Decoding: The Nearest Neighbour method The fastest method for Bayer array decoding. It uses the nearest pixel with the required lense color to get the pixel value. Gives rough results.

- Supported input pixel formats: 8-bit mono.
- Supported output pixel formats: 8-bit mono, 24-bit BGR, 32-bit BGR.
- Can be done in-place: No.

Parameters

<i>pSrcImgInfo</i>	Bayer encoded source image info
<i>pDstImgInfo</i>	Destination image info
<i>DstPixelFormat</i>	To which LvPixelFormat
<i>Options</i>	Options - OR-ed combination of LvipOption . If the LvipOption_ReallocateDst is used, then also can contain attributes from LvipImgAttr for (re)allocated image.
<i>hLut</i>	Handle to LUT

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.41.2.6 LV_EXTC LV_DLLIMPORT LvStatus LvipBdPixelGrouping (LvipImgInfo * pSrcImgInfo, LvipImgInfo * pDstImgInfo, uint32_t DstPixelFormat, uint32_t Options)

Bayer Decoding: The Pixel Grouping method. A method similar to the [LvipBdVariableGradients\(\)](#), but simplified and thus faster, still giving very good results.

- Supported input pixel formats: 8-bit mono.
- Supported output pixel formats: 24-bit BGR, 32-bit BGR.
- Can be done in-place: No.

Note

This function does not support LUT operations because of too high CPU load

Parameters

<i>pSrcImgInfo</i>	Bayer encoded source image info
<i>pDstImgInfo</i>	Destination image info
<i>DstPixelFormat</i>	To which LvPixelFormat convert
<i>Options</i>	Options - OR-ed combination of LvipOption . If the LvipOption_ReallocateDst is used, then also can contain attributes from LvipImgAttr for (re)allocated image.

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.41.2.7 LV_EXTC LV_DLLIMPORT LvStatus LvipBdShowMosaic (LvipImgInfo * pSrcImgInfo, LvipImgInfo * pDstImgInfo, uint32_t DstPixelFormat, uint32_t Options)

Bayer Decoding: Show mosaic. This function converts the Bayer encoded image to RGB format, without decoding the color information, only showing in the color how the image is seen by the chip after the light goes through the color lenses. The purpose of this function is only to help in Bayer decoding algorithms investigations.

- Supported input pixel formats: 8-bit mono.
- Supported output pixel formats: 24-bit BGR, 32-bit BGR.
- Can be done in-place: No.

Parameters

<i>pSrcImgInfo</i>	Bayer encoded image
<i>pDstImgInfo</i>	Where to save displayable image
<i>DstPixelFormat</i>	To which LvPixelFormat convert bayer encoded image
<i>Options</i>	Options - OR-ed combination of LvipOption . If the LvipOption_ReallocateDst is used, then also can contain attributes from LvipImgAttr for (re)allocated image.

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.41.2.8 LV_EXTC LV_DLLIMPORT LvStatus LvipBdVariableGradients (LvipImgInfo * pSrcImgInfo, LvipImgInfo * pDstImgInfo, uint32_t DstPixelFormat, uint32_t Options, LvipHLut hLut)

Bayer Decoding: Variable gradients method One of the best known methods for Bayer decoding, but significantly slower than the bilinear interpolation. It is based on evaluation the color gradients in 8 directions around the pixel and selecting the set of best set for the color interpolation.

- Supported input pixel formats: 8-bit mono.
- Supported output pixel formats: 24-bit BGR, 32-bit BGR.
- Can be done in-place: No.

Parameters

<i>pSrcImgInfo</i>	Bayer encoded source image info
<i>pDstImgInfo</i>	Destination image info
<i>DstPixelFormat</i>	To which LvPixelFormat convert
<i>Options</i>	Options - OR-ed combination of LvipOption . If the LvipOption_ReallocateDst is used, then also can contain attributes from LvipImgAttr for (re)allocated image.
<i>hLut</i>	Handle to LUT

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.42 Rotation and line manipulation functions

Functions

- LV_EXTC LV_DLLIMPORT LvStatus LvipDeinterlace (LvimgInfo *pSrcImgInfo, LvimgInfo *pDstImgInfo, uint32_t Options)
- LV_EXTC LV_DLLIMPORT LvStatus LvipRotate90 (LvimgInfo *pSrcImgInfo, LvimgInfo *pDstImgInfo, int32_t ClockWise, uint32_t Options, LvipHLut hLut)
- LV_EXTC LV_DLLIMPORT LvStatus LvipMirror (LvimgInfo *pSrcImgInfo, LvimgInfo *pDstImgInfo, int32_t TopBottomMirror, int32_t LeftRightMirror, uint32_t Options, LvipHLut hLut)
- LV_EXTC LV_DLLIMPORT LvStatus LvipRotate90AndMirror (LvimgInfo *pSrcImgInfo, LvimgInfo *pDstImgInfo, int32_t ClockWise, int32_t TopBottomMirror, int32_t LeftRightMirror, uint32_t Options, LvipHLut hLut)
- LV_EXTC LV_DLLIMPORT LvStatus LvipReverseLines (LvimgInfo *pSrcImgInfo, LvimgInfo *pDstImgInfo, uint32_t Options)
- LV_EXTC LV_DLLIMPORT LvStatus LvipReverseLinesFast (LvimgInfo *pSrcImgInfo, LvimgInfo *pDstImgInfo, void *pLineBuffer, uint32_t Options)

5.42.1 Detailed Description

5.42.2 Function Documentation

5.42.2.1 LV_EXTC LV_DLLIMPORT LvStatus LvipDeinterlace (LvimgInfo * pSrcImgInfo, LvimgInfo * pDstImgInfo, uint32_t Options)

Deinterlacing. Deinterlaces by averaging the neighbour lines. Deinterlace function reduces the artefacts resulting from capturing a moving object by an interlaced camera.

- Supported input pixel formats: 8-bit mono, 15-bit BGR, 16-bit BGR, 24-bit BGR, 32-bit BGR.
- Supported output pixel formats: equal to the input pixel format.
- Can be done in-place: Yes (DstImgInfo can be NULL).

Parameters

<i>pSrcImgInfo</i>	Source image info
<i>pDstImgInfo</i>	Destination image info
<i>Options</i>	Options - OR-ed combination of LvipOption . If the LvipOption_ReallocateDst is used, then also can contain attributes from LvipImgAttr for (re)allocated image.

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.42.2.2 LV_EXTC LV_DLLIMPORT LvStatus LvipMirror (LvimgInfo * pSrcImgInfo, LvimgInfo * pDstImgInfo, int32_t TopBottomMirror, int32_t LeftRightMirror, uint32_t Options, LvipHLut hLut)

Mirrors the image along the horizontal axis (TopBottomMirror) or vertical axis (LeftRightMirror).

- Supported input pixel formats: 8-bit mono, 15-bit BGR, 16-bit BGR, 24-bit BGR, 32-bit BGR.
- Supported output pixel formats: equal to the input pixel format.
- Can be done in-place: Yes (DstImgInfo can be NULL).

Parameters

<i>pSrcImgInfo</i>	Source image info
<i>pDstImgInfo</i>	Destination image info.
<i>TopBottomMirror</i>	1 for top-bottom mirror, 0 if not
<i>LeftRightMirror</i>	1 for left-right mirror, 0 if not
<i>Options</i>	Options - OR-ed combination of LvipOption . If the LvipOption_ReallocateDst is used, then also can contain attributes from LviplmgAttr for (re)allocated image.
<i>hLut</i>	Handle to LUT

Returns

LVSTATUS_OK in case of success, or error status in case of failure

Note

the LUT in this function is not yet implemented.

5.42.2.3 LV_EXTC LV_DLLIMPORT LvStatus LvipReverseLines (LviplmgInfo * pSrcImgInfo, LviplmgInfo * pDstImgInfo, uint32_t Options)

Reversed lines for switching between the top-down and bottom-up formats. Performs the same action as [TopBottomMirror](#), but updates also the [LviplmgInfo](#) with a flag indicating the orientation (this has a meaning when switching between top-down and bottom-up formats).

- Supported input pixel formats: 8-bit mono, 15-bit BGR, 16-bit BGR, 24-bit BGR, 32-bit BGR.
- Supported output pixel formats: equal to the input pixel format.
- Can be done in-place: Yes ([DstImgInfo](#) can be NULL).

Parameters

<i>pSrcImgInfo</i>	Source image info
<i>pDstImgInfo</i>	Destination image info
<i>Options</i>	Options - OR-ed combination of LvipOption . If the LvipOption_ReallocateDst is used, then also can contain attributes from LviplmgAttr for (re)allocated image.

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.42.2.4 LV_EXTC LV_DLLIMPORT LvStatus LvipReverseLinesFast (LviplmgInfo * pSrcImgInfo, LviplmgInfo * pDstImgInfo, void * pLineBuffer, uint32_t Options)

Fastly reverses lines (copying whole lines). The [pDstImgInfo](#) can be NULL (in-place reversion). In such case a temporary buffer for a line is needed.

The buffer can be supplied in [pLineBuffer](#) (must have sufficient size to hold the whole line in its pixel format, that means \geq [ImgInfo.dwLineIncrement](#)).

If the [pLineBuffer](#) is NULL, the buffer is temporarily allocated and deallocated, which might require additional CPU time, so for the repeated call of this function it is better to allocate the buffer outside the function and pass it as [pLineBuffer](#) parameter.

- Supported input pixel formats: 8-bit mono, 15-bit BGR, 16-bit BGR, 24-bit BGR, 32-bit BGR.
- Supported output pixel formats: equal to the input pixel format.
- Can be done in-place: Yes ([DstImgInfo](#) can be NULL).

Parameters

<i>pSrcImgInfo</i>	Source image info
<i>pDstImgInfo</i>	Destination image info; can be NULL - then in-place reversion will be done (but in this case a temporary buffer for line is needed)
<i>pLineBuffer</i>	Pointer to temporary line buffer. Can be NULL.
<i>Options</i>	Options - OR-ed combination of LvIpOption . If the LvIpOption_ReallocateDst is used, then also can contain attributes from LvIpImgAttr for (re)allocated image.

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.42.2.5 LV_EXTC LV_DLLIMPORT LvStatus LvIpRotate90 (LvIpImgInfo * pSrcImgInfo, LvIpImgInfo * pDstImgInfo, int32_t ClockWise, uint32_t Options, LvIpHLut hLut)

Rotates the image by 90 degrees clockwise or counterclockwise.

- Supported input pixel formats: 8-bit mono, 15-bit BGR, 16-bit BGR, 24-bit BGR, 32-bit BGR.
- Supported output pixel formats: equal to the input pixel format.
- Can be done in-place: No.

Note

the LUT in this function is not yet implemented.

For 180 degrees rotation use the [LvIpMirror\(\)](#) function and set mirroring along both axes.

Parameters

<i>pSrcImgInfo</i>	Source image info
<i>pDstImgInfo</i>	Destination image info
<i>ClockWise</i>	1 if the image has to be rotated clockwise, 0 if the image has to be rotated by counterclockwise
<i>Options</i>	Options - OR-ed combination of LvIpOption . If the LvIpOption_ReallocateDst is used, then also can contain attributes from LvIpImgAttr for (re)allocated image.
<i>hLut</i>	Handle to LUT

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.42.2.6 LV_EXTC LV_DLLIMPORT LvStatus LvIpRotate90AndMirror (LvIpImgInfo * pSrcImgInfo, LvIpImgInfo * pDstImgInfo, int32_t ClockWise, int32_t TopBottomMirror, int32_t LeftRightMirror, uint32_t Options, LvIpHLut hLut)

It does the rotation and mirroring in the same step. If the Options contain [LvIpOption_ReallocateDst](#) and the [pDstImgInfo](#) contains different image width or height or the [pData](#) is NULL, the [pData](#) is reallocated and the image parameters are adjusted. The Options in such case can contain also [LvIpImgAttr](#) flags for new image descriptor creation.

- Supported input pixel formats: 8-bit mono, 15-bit BGR, 16-bit BGR, 24-bit BGR, 32-bit BGR.
- Supported output pixel formats: equal to the input pixel format.
- Can be done in-place: No.

Parameters

<i>pSrcImgInfo</i>	Source image info
<i>pDstImgInfo</i>	Destination image info
<i>ClockWise</i>	1 if image has to be rotated by 90 degrees clockwise, otherwise (counterclockwise) 0
<i>TopBottomMirror</i>	1 if top-bottom mirror has to be used, otherwise 0
<i>LeftRightMirror</i>	1 if left-right mirror has to be used, otherwise 0
<i>Options</i>	Options - OR-ed combination of LvipOption . If the <code>LvipOption_ReallocateDst</code> is used, then also can contain attributes from LviplmgAttr for (re)allocated image.
<i>hLut</i>	Handle to LUT

Returns

LVSTATUS_OK in case of success, or error status in case of failure

Note

the LUT in this function is not yet implemented.

5.43 Pixel format conversion functions

Functions

- LV_EXTC LV_DLLIMPORT LvStatus LvipConvertToPixelFormat (LvImgInfo *pSrcImgInfo, LvImgInfo *pDstImgInfo, uint32_t DstPixelFormat, uint32_t Options)
- LV_EXTC LV_DLLIMPORT uint32_t LvipCanConvertToPixelFormat (uint32_t dwSrcPixelFormat, uint32_t dwDstPixelFormat)

5.43.1 Detailed Description

5.43.2 Function Documentation

5.43.2.1 LV_EXTC LV_DLLIMPORT uint32_t LvipCanConvertToPixelFormat (uint32_t dwSrcPixelFormat, uint32_t dwDstPixelFormat)

Returns 1 if the source pixel format can be converted to destination pixel format by the [LvipConvertToPixelFormat\(\)](#) function.

Parameters

<i>dwSrcPixelFormat</i>	Source LvPixelFormat
<i>dwDstPixelFormat</i>	Destination LvPixelFormat

Returns

1 in case of the conversion is available, otherwise 0.

5.43.2.2 LV_EXTC LV_DLLIMPORT LvStatus LvipConvertToPixelFormat (LvImgInfo * pSrcImgInfo, LvImgInfo * pDstImgInfo, uint32_t DstPixelFormat, uint32_t Options)

Converts the image from one pixel format to another one.

- Supported input pixel formats: 8-bit to 16-bit mono, 15-bit BGR, 16-bit BGR, 24-bit BGR, 32-bit BGR.
- Supported output pixel formats: 8-bit mono, 24-bit BGR, 32-bit BGR.
- Can be done in-place: No.

Parameters

<i>pSrcImgInfo</i>	Source Image Info
<i>pDstImgInfo</i>	Destination Image Info
<i>DstPixelFormat</i>	Destination LvPixelFormat
<i>Options</i>	Options - OR-ed combination of LvipOption . If the LvipOption_ReallocateDst is used, then also can contain attributes from LvipImgAttr for (re)allocated image.

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.44 Saving/loading functions

Functions

- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvipSaveToTiff](#) (const char *pFileName, [LvipImgInfo](#) *pImgInfo, uint32_t Options)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvipLoadFromTiff](#) (const char *pFileName, [LvipImgInfo](#) *pImgInfo, uint32_t Options)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvipSaveToBmp](#) (const char *pFileName, [LvipImgInfo](#) *pImgInfo, uint32_t Options)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvipLoadFromBmp](#) (const char *pFileName, [LvipImgInfo](#) *pImgInfo, uint32_t Options)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvipSaveToJpeg](#) (const char *pFileName, [LvipImgInfo](#) *pImgInfo, uint32_t QualityFactor)
- LV_EXTC LV_DLLIMPORT [LvStatus](#) [LvipLoadFromJpeg](#) (const char *pFileName, [LvipImgInfo](#) *pImgInfo, uint32_t Options)

5.44.1 Detailed Description

5.44.2 Function Documentation

5.44.2.1 LV_EXTC LV_DLLIMPORT LvStatus LvipLoadFromBmp (const char * pFileName, LvipImgInfo * pImgInfo, uint32_t Options)

Loads image from BMP file. Formats with less 8 bits per pixel are not supported. The color palette by 8-bit pixel format is expected to be greyscale.

Parameters

<i>pFileName</i>	File name
<i>pImgInfo</i>	Image info for the loaded image
<i>Options</i>	Options - OR-ed combination of LvipOption . If the LvipOption_ReallocateDst is used, then also can contain attributes from LvipImgAttr for (re)allocated image.

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.44.2.2 LV_EXTC LV_DLLIMPORT LvStatus LvipLoadFromJpeg (const char * pFileName, LvipImgInfo * pImgInfo, uint32_t Options)

Loads the image from JPEG file.

Parameters

<i>pFileName</i>	File name.
<i>pImgInfo</i>	Image info for the loaded image.
<i>Options</i>	Options - OR-ed combination of LvipOption . If the LvipOption_ReallocateDst is used, then also can contain attributes from LvipImgAttr for (re)allocated image. See LvipOption_Jpeg↔ConvertToBgr , LvipOption_JpegReadHeaderOnly and LvipOption_ReallocateDst .

Returns

LVSTATUS_OK in case of success, or error status in case of failure

Note

You can either supply the `plmgInfo` with already allocated buffer or use empty `ImgInfo` and specify the [LvipOption_ReallocateDst](#) flag. In the first case you can utilize the [LvipOption_JpegReadHeaderOnly](#) flag to obtain the image attributes.

5.44.2.3 LV_EXTC LV_DLLIMPORT LvStatus LvipLoadFromTiff (const char * *pFileName*, LvipImgInfo * *plmgInfo*, uint32_t *Options*)

Loads the image from TIFF file. Is preferred to load the image from TIFF file which had been previously saved by [LvipSaveToTiff\(\)](#) function - this library supports only a base TIFF format and there it is not assured that the TIFF image created by another application could be loaded without error.

Parameters

<i>pFileName</i>	File name
<i>plmgInfo</i>	Image info for the loaded image.
<i>Options</i>	Options - OR-ed combination of LvipOption . If the LvipOption_ReallocateDst is used, then also can contain attributes from LvipImgAttr for (re)allocated image.

Returns

LVSTATUS_OK in case of success, or error status in case of failure

Note

The `pData` are always reallocated.

5.44.2.4 LV_EXTC LV_DLLIMPORT LvStatus LvipSaveToBmp (const char * *pFileName*, LvipImgInfo * *plmgInfo*, uint32_t *Options*)

Saves the image to a BMP file if the pixel format is compatible with BMP. *Compatible with BMP* means that [LvPixelFormat](#) is one of 8-bit mono, 24- or 32-bit BGR.

- Supported pixel formats: 8-bit mono, 15-bit BGR, 16-bit BGR, 24-bit BGR, 32-bit BGR.

Parameters

<i>pFileName</i>	File name
<i>plmgInfo</i>	Image info of an image to be saved
<i>Options</i>	Options - OR-ed combination of LvipOption .

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.44.2.5 LV_EXTC LV_DLLIMPORT LvStatus LvipSaveToJpeg (const char * *pFileName*, LvipImgInfo * *plmgInfo*, uint32_t *QualityFactor*)

Saves the image to the JPEG file. In contrast to the BMP format, it enables to store also 9- to 16-bit mono formats.

- Supported pixel formats: 8-bit to 16-bit mono, all RGB and BGR formats. For JPEG the native pixel format is either 8-bit mono or 24-bit BGR. If the image is in different pixel format, it is automatically converted to one of these 2 formats.

Parameters

<i>pFileName</i>	File name.
<i>plmgInfo</i>	Image info of an image to be saved.
<i>QualityFactor</i>	The quality factor in range from 0 to 100. The higher the quality, the lower is the compression. The default quality is 75.

Returns

LVSTATUS_OK in case of success, or error status in case of failure.

5.44.2.6 LV_EXTC LV_DLLIMPORT LvStatus LvipSaveToTiff (const char * *pFileName*, LvipLmgInfo * *plmgInfo*, uint32_t *Options*)

Saves the image to the TIFF file. In contrast to the BMP format, it enables to store also 9- to 16-bit mono formats.

The flag LvipOption_TiffConvertTo16Bit can be used to force the conversion to 16bit format, which is supported by wider range of applications.

- Supported pixel formats: 8-bit to 16-bit mono, 15-bit BGR, 16-bit BGR, 24-bit BGR, 32-bit BGR.

Parameters

<i>pFileName</i>	File name
<i>plmgInfo</i>	Image info of an image to be saved
<i>Options</i>	Options - OR-ed combination of LvipOption .

Returns

LVSTATUS_OK in case of success, or error status in case of failure.

5.45 Overlay functions

5.46 RGB color correction and convolution functions

Functions

- LV_EXTC LV_DLLIMPORT [LvStatus LvipApplyRgbColorCorrection](#) ([LvIpImgInfo](#) *pSrcImgInfo, [LvIpImgInfo](#) *pDstImgInfo, int32_t *piMatrix, uint32_t Options, LvIpHLut hLut)
- LV_EXTC LV_DLLIMPORT [LvStatus LvipSetSaturationMatrix](#) (uint32_t SaturationFactor, int32_t *piMatrix, uint32_t Options)
- LV_EXTC LV_DLLIMPORT [LvStatus LvipSet3x3MatrixSharpening](#) (int32_t Factor, int32_t *piMatrix, uint32_t Options)
- LV_EXTC LV_DLLIMPORT [LvStatus LvipApply3x3Convolution](#) ([LvIpImgInfo](#) *pSrcImgInfo, [LvIpImgInfo](#) *pDstImgInfo, int32_t *piMatrix, uint32_t Options, LvIpHLut hLut)

5.46.1 Detailed Description

5.46.2 Function Documentation

5.46.2.1 LV_EXTC LV_DLLIMPORT LvStatus LvipApply3x3Convolution ([LvIpImgInfo](#) * *pSrcImgInfo*, [LvIpImgInfo](#) * *pDstImgInfo*, int32_t * *piMatrix*, uint32_t *Options*, LvIpHLut *hLut*)

Does 3x3 convolution. Applies the 3x3 matrix convolution operation. Typically, if the matrix is set for sharpening, sharpens the image.

See also

[LvipSet3x3MatrixSharpening\(\)](#) for creation of the sharpening matrix.

- Supported input pixel formats: 8-bit to 16-bit mono, 24-bit BGR, 32-bit BGR.
- Supported output pixel formats: equal to the input pixel format.
- Can be done in-place: No.

Parameters

<i>pSrcImgInfo</i>	Source image
<i>pDstImgInfo</i>	Destination image info
<i>piMatrix</i>	Matrix for the convolution operation.
<i>Options</i>	Options - OR-ed combination of LvIpOption . If the LvIpOption_ReallocateDst is used, then also can contain attributes from LvIpImgAttr for (re)allocated image.
<i>hLut</i>	Handle to LUT

Returns

LVSTATUS_OK in case of success, or error status in case of failure

Note

the LUT in this function is not yet implemented.

5.46.2.2 LV_EXTC LV_DLLIMPORT LvStatus LvipApplyRgbColorCorrection ([LvIpImgInfo](#) * *pSrcImgInfo*, [LvIpImgInfo](#) * *pDstImgInfo*, int32_t * *piMatrix*, uint32_t *Options*, LvIpHLut *hLut*)

RGB color correction. A color correction 3x3 matrix is applied to RGB components of each pixel.

- Supported input pixel formats: 24-bit BGR, 32-bit BGR, 24-bit BGR, 32-bit BGR.
- Supported output pixel formats: equal to the input pixel format.
- Can be done in-place: Yes (DstImgInfo can be NULL).

Parameters

<i>pSrcImgInfo</i>	Image which needs to correct colors
<i>pDstImgInfo</i>	Where to save image with correct colors
<i>piMatrix</i>	3x3 matrix used to correct colors. It could be filled up using LvipSetSaturationMatrix() . The factors in the matrix are expressed as multiplied by 1000, that means 1000 = factor 1.0.
<i>Options</i>	Options - OR-ed combination of LvipOption . If the LvipOption_ReallocateDst is used, then also can contain attributes from LviplmgAttr for (re)allocated image.
<i>hLut</i>	Handle to LUT (could be NULL)

Returns

LVSTATUS_OK in case of success, or error status in case of failure

Note

the LUT in this function is not yet implemented.

5.46.2.3 LV_EXTC LV_DLLIMPORT LvStatus LvipSet3x3MatrixSharpening (int32_t Factor, int32_t * piMatrix, uint32_t Options)

Sets up sharpening matrix. Fills the matrix with weighted values for 3x3 sharpening.

The factor is 0 for no-change matrix, +100 for maximum sharpening, -100 for blurring

Parameters

<i>Factor</i>	Factor of sharpening
<i>piMatrix</i>	3x3 matrix of int32_t values which will obtain the calculated values
<i>Options</i>	Options: 0 for faster sharpening from 4 neighboring pixels, 1 for full sharpening from 8 neighboring pixels.

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.46.2.4 LV_EXTC LV_DLLIMPORT LvStatus LvipSetSaturationMatrix (uint32_t SaturationFactor, int32_t * piMatrix, uint32_t Options)

Sets up the color saturation 3x3 matrix. The saturation factor is in percents, eg. 100 = 1.0 = unchanged image. The matrix can be used as parameter in the [LvipApplyRgbColorCorrection\(\)](#) function.

Parameters

<i>SaturationFactor</i>	the saturation factor in percents
<i>piMatrix</i>	3x3 matrix of int32_t values which will obtain the calculated factors
<i>Options</i>	Options, reserved for future use, must be 0.

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.47 Shading correction functions

Functions

- LV_EXTC LV_DLLIMPORT LvStatus LvipApplyShadingCorrection (LvIpImgInfo *pSrcImgInfo, LvIpImgInfo *pDstImgInfo, LvIpImgInfo *pBlackRefImgInfo, LvIpImgInfo *pWhiteRefImgInfo, uint32_t Options, LvIpHLut hLut)

5.47.1 Detailed Description

5.47.2 Function Documentation

5.47.2.1 LV_EXTC LV_DLLIMPORT LvStatus LvipApplyShadingCorrection (LvIpImgInfo * pSrcImgInfo, LvIpImgInfo * pDstImgInfo, LvIpImgInfo * pBlackRefImgInfo, LvIpImgInfo * pWhiteRefImgInfo, uint32_t Options, LvIpHLut hLut)

Applies the shading correction. The pBlackRefImgInfo and pWhiteRefImgInfo must be either NULL or must point to a valid image of the same pixel format as the pSrcImgInfo.

- Supported input pixel formats: 8-bit to 16-bit mono, 24-bit BGR, 32-bit BGR.
- Supported output pixel formats: equal to the input pixel format.
- Can be done in-place: Yes (DstImgInfo can be NULL).

Parameters

<i>pSrcImgInfo</i>	Source image info
<i>pDstImgInfo</i>	Destination image info
<i>pBlackRefImgInfo</i>	Black reference image
<i>pWhiteRefImgInfo</i>	White reference image
<i>Options</i>	Options - OR-ed combination of LvIpOption . If the LvIpOption_ReallocateDst is used, then also can contain attributes from LvIpImgAttr for (re)allocated image.
<i>hLut</i>	Handle to LUT

Returns

LVSTATUS_OK in case of success, or error status in case of failure

5.48.1 Detailed Description

The sv.synview.ini is a helper library, enabling to read and write INI files in all supported operating systems.

5.48.2 Function Documentation

5.48.2.1 LV_EXTC LVINI_PUBLIC void LvIniClose (LvHIniFile *hIniFile*)

Closes the INI file underlying structures and all its parents. It does not write the contents to disk; if you want to save the INI content, use first [LvIniSave\(\)](#).

Parameters

<i>hIniFile</i>	Handle to the INI file.
-----------------	-------------------------

5.48.2.2 LV_EXTC LVINI_PUBLIC void LvIniDeleteItem (LvHIniFile *hIniFile*, const char * *pSection*, const char * *pName*, uint32_t *Order*)

Deletes the item.

Parameters

<i>hIniFile</i>	Handle to the INI file.
<i>pSection</i>	Section in the INI file (without brackets).
<i>pName</i>	Name of the item in the section.
<i>Order</i>	Can be used to distinguish between multiple items of the same name in one section.

5.48.2.3 LV_EXTC LVINI_PUBLIC void LvIniDeleteSection (LvHIniFile *hIniFile*, const char * *pSection*)

Deletes the section.

Parameters

<i>hIniFile</i>	Handle to the INI file.
<i>pSection</i>	Section in the INI file (without brackets).

5.48.2.4 LV_EXTC LVINI_PUBLIC uint32_t LvIniGetBool (LvHIniFile *hIniFile*, const char * *pSection*, const char * *pName*, uint32_t *Default*, uint32_t *Order*)

Reads a boolean value.

Parameters

<i>hIniFile</i>	Handle to the INI file.
<i>pSection</i>	Section in the INI file (without brackets).
<i>pName</i>	Name of the item in the section.
<i>Default</i>	Default value to be used when the item is not found or is empty.
<i>Order</i>	Can be used to distinguish between multiple items of the same name in one section.

Returns

Read value (0 or 1).

5.48.2.5 LV_EXTC LVINI_PUBLIC double LvIniGetFloat (LvHIniFile *hIniFile*, const char * *pSection*, const char * *pName*, double *Default*, uint32_t *Order*)

Reads a float value.

Parameters

<i>hIniFile</i>	Handle to the INI file.
<i>pSection</i>	Section in the INI file (without brackets).
<i>pName</i>	Name of the item in the section.

<i>Default</i>	Default value to be used when the item is not found or is empty.
<i>Order</i>	Can be used to distinguish between multiple items of the same name in one section.

Returns

Read value.

5.48.2.6 LV_EXTC LVINI_PUBLIC int32_t LvIniGetInteger (LvHIniFile *hIniFile*, const char * *pSection*, const char * *pName*, int32_t *Default*, uint32_t *Order*)

Reads an integer value.

Parameters

<i>hIniFile</i>	Handle to the INI file.
<i>pSection</i>	Section in the INI file (without brackets).
<i>pName</i>	Name of the item in the section.
<i>Default</i>	Default value to be used when the item is not found or is empty.
<i>Order</i>	Can be used to distinguish between multiple items of the same name in one section.

Returns

Read value.

5.48.2.7 LV_EXTC LVINI_PUBLIC void LvIniGetSectionRawLine (LvHIniFile *hIniFile*, const char * *pSection*, char * *pLine*, uint32_t *Size*, uint32_t *Order*)

Gets the raw string in specified section at position, specified by Order. Commented out and empty lines are not counted. If the item is not found, empty string is returned.

Parameters

<i>hIniFile</i>	Handle to the INI file.
<i>pSection</i>	Section in the INI file (without brackets).
<i>pLine</i>	Buffer for the line contents.
<i>Size</i>	Size of the pLine buffer.
<i>Order</i>	Order of the raw line. The first valid line has Order=1

5.48.2.8 LV_EXTC LVINI_PUBLIC uint32_t LvIniGetSectionRawLineSize (LvHIniFile *hIniFile*, const char * *pSection*, uint32_t *Order*)

Gets the raw size of buffer needed for the raw line in specified section at position, specified by Order. Commented out and empty lines are not counted. If the item is not found, empty string is returned.

Parameters

<i>hIniFile</i>	Handle to the INI file.
<i>pSection</i>	Section in the INI file (without brackets).
<i>Order</i>	Order of the raw line. The first valid line has Order=1.

Returns

Size of the buffer (string length+1).

5.48.2.9 LV_EXTC LVINI_PUBLIC void LvIniGetString (LvHIniFile *hIniFile*, const char * *pSection*, const char * *pName*, const char * *pDefault*, char * *pString*, uint32_t *Size*, uint32_t *Order*)

Reads a string value.

Parameters

<i>hIniFile</i>	Handle to the INI file.
<i>pSection</i>	Section in the INI file (without brackets).
<i>pName</i>	Name of the item in the section.
<i>pDefault</i>	Default value to be used when the item is not found or is empty.
<i>pString</i>	The string value is returned in this parameter.
<i>Size</i>	Size of the pString buffer.
<i>Order</i>	Can be used to distinguish between multiple items of the same name in one section.

5.48.2.10 LV_EXTC LVINI_PUBLIC uint32_t LvIniGetStringSize (LvHIniFile *hIniFile*, const char * *pSection*, const char * *pName*, const char * *pDefault*, uint32_t *Order*)

Returns a size of buffer needed to read the string.

Parameters

<i>hIniFile</i>	Handle to the INI file.
<i>pSection</i>	Section in the INI file (without brackets).
<i>pName</i>	Name of the item in the section.
<i>pDefault</i>	Default value to be used when the item is not found or is empty.
<i>Order</i>	Can be used to distinguish between multiple items of the same name in one section.

Returns

Size of the buffer (string length+1).

5.48.2.11 LV_EXTC LVINI_PUBLIC uint32_t LvIniItemExists (LvHIniFile *hIniFile*, const char * *pSection*, const char * *pName*, uint32_t *Order*)

Checks if the item exists.

Parameters

<i>hIniFile</i>	Handle to the INI file.
<i>pSection</i>	Section in the INI file (without brackets).
<i>pName</i>	Name of the item in the section.
<i>Order</i>	Can be used to distinguish between multiple items of the same name in one section.

Returns

The return value 1 indicates the existence of the item.

5.48.2.12 LV_EXTC LVINI_PUBLIC uint32_t LvIniLoad (LvHIniFile *hIniFile*, const char * *pFileName*)

Loads the ini file contents. All subsequent changes are done in memory, until the ini file is saved by the [LvIniSave\(\)](#) function. If there is a parent already specified (see [LvIniSetParent\(\)](#)), it is opened (recursively) as well.

Parameters

<i>hIniFile</i>	Handle to the INI file.
<i>pFileName</i>	The INI file name.

Returns

If the file does not exist, or file I/O fails, it returns 0, otherwise 1.

5.48.2.13 LV_EXTC LVINI_PUBLIC uint32_t LvIniModified (LvHIniFile *hIniFile*)

Returns 1 if the file content was modified.

Returns

1 if at least one item was modified or deleted or section deleted.

5.48.2.14 LV_EXTC LVINI_PUBLIC LvHIniFile LvIniOpen (const char * *pCommentSeparator*)

Creates the INI file underlying structures and returns a handle to it. It does not read the INI file contents, this is done by [LvIniLoad\(\)](#).

Parameters

<i>pCommentSeparator</i>	If specified, all lines where it appears at the beginning of the line are considered to be a comment. It need not be placed at the very first position, but to the left must be only whitespace characters, otherwise the line is not considered to be a comment. If a value is commented out and the new value of the same name is written, it is placed before the commented value (not to the end of the section).
--------------------------	---

5.48.2.15 LV_EXTC LVINI_PUBLIC uint32_t LvIniSave (LvHIniFile *hIniFile*, const char * *pFileName*, uint32_t *CreateBackup*)

Saves the INI file contents to a file.

Parameters

<i>hIniFile</i>	Handle to the INI file.
<i>pFileName</i>	The INI file name.
<i>CreateBackup</i>	If is set, the original file is preserved with added ".bak" extension.

Returns

The return value 1 indicates a success of the file I/O.

5.48.2.16 LV_EXTC LVINI_PUBLIC uint32_t LvIniSectionExists (LvHIniFile *hIniFile*, const char * *pSection*)

Checks is the section exists.

Parameters

<i>hIniFile</i>	Handle to the INI file.
<i>pSection</i>	Section in the INI file (without brackets).

Returns

1 if the section exists.

5.48.2.17 LV_EXTC LVINI_PUBLIC void LvIniSetBool (LvHIniFile *hIniFile*, const char * *pSection*, const char * *pName*, uint32_t *Value*, uint32_t *Order*)

Writes a boolean value.

Parameters

<i>hIniFile</i>	Handle to the INI file.
<i>pSection</i>	Section in the INI file (without brackets).
<i>pName</i>	Name of the item in the section.
<i>Value</i>	Value of the item to be set.
<i>Order</i>	Can be used to distinguish between multiple items of the same name in one section.

5.48.2.18 LV_EXTC LVINI_PUBLIC void LvIniSetFloat (LvHIniFile *hIniFile*, const char * *pSection*, const char * *pName*, double *Value*, uint32_t *Order*)

Writes a float value.

Parameters

<i>hIniFile</i>	Handle to the INI file.
<i>pSection</i>	Section in the INI file (without brackets).
<i>pName</i>	Name of the item in the section.
<i>Value</i>	Value of the item to be set.
<i>Order</i>	Can be used to distinguish between multiple items of the same name in one section.

5.48.2.19 LV_EXTC LVINI_PUBLIC void LvIniSetInteger (LvHIniFile *hIniFile*, const char * *pSection*, const char * *pName*, int32_t *Value*, uint32_t *Hexadecimal*, uint32_t *Order*)

Writes an integer value.

Parameters

<i>hIniFile</i>	Handle to the INI file.
<i>pSection</i>	Section in the INI file (without brackets).
<i>pName</i>	Name of the item in the section.
<i>Value</i>	Value of the item to be set.
<i>Hexadecimal</i>	If true, the value is written as hexa with the "0x" prefix.
<i>Order</i>	Can be used to distinguish between multiple items of the same name in one section.

5.48.2.20 LV_EXTC LVINI_PUBLIC void LvIniSetParent (LvHIniFile *hIniFile*, const char * *pSection*, const char * *pName*)

Sets the section and name, where the specification of the parent INI file should be read. For example for the following INI the call would be SetParent("Linked", "Parent");

```
1 [Linked]
2 Parent=main.ini
```

Use empty strings to disable the parent.

When you specify a parent, you can automatically work with a hierarchy of INI files - when the file is open, it searches for a section and name, specified in the SetParent() function. If found and a valid file name is specified there, it creates a parent class instance and reads to it the contents of the file. Then every item, which is not explicitly specified in own INI file is searched in this parent INI file. The opening is recursive - the parent INI can have its own parent etc., so be sure you do not make a circular reference. The maximum level of recursion is intentionally limited to 10.

Parameters

<i>hIniFile</i>	Handle to the INI file.
<i>pSection</i>	Section in the INI file (without brackets).
<i>pName</i>	Name of the item in the section.

5.48.2.21 LV_EXTC LVINI_PUBLIC void LvIniSetSectionRawLine (LvHIniFile *hIniFile*, const char * *pSection*, const char * *pLine*, uint32_t *Order*)

Sets the raw string in specified section at position, specified by Order. Commented out and empty lines are not counted. The first valid line has Order=1 If the item with the Order is not found, a new line is created and added at the end of section.

Parameters

<i>hIniFile</i>	Handle to the INI file.
<i>pSection</i>	Section in the INI file (without brackets).
<i>pLine</i>	The raw line to be set.
<i>Order</i>	Order of the raw line.

5.48.2.22 LV_EXTC LVINI_PUBLIC void LvIniSetString (LvHIniFile *hIniFile*, const char * *pSection*, const char * *pName*, const char * *pValue*, uint32_t *Order*)

Writes a string value.

Parameters

<i>hIniFile</i>	Handle to the INI file.
<i>pSection</i>	Section in the INI file (without brackets).
<i>pName</i>	Name of the item in the section.
<i>pValue</i>	Value of the item to be set.
<i>Order</i>	Can be used to distinguish between multiple items of the same name in one section.

Typedefs

- `typedef uint32_t LvStatus`

5.49.1 Detailed Description

5.49.2 Macro Definition Documentation

5.49.2.1 `#define LVSTATUS_ACQUISITION_CANNOT_BE_STARTED`

The AcquisitionStart command cannot be executed. This is probably because the acquisition is already running, or the conditions for starting the acquisition are not satisfied.

Definition at line 212 of file sv.synview.status.h.

5.49.2.2 `#define LVSTATUS_ACQUISITION_CANNOT_BE_STOPPED`

The AcquisitionStop command cannot be executed. This is probably because the acquisition already had been stopped, or the conditions for stopping the acquisition are not satisfied.

Definition at line 216 of file sv.synview.status.h.

5.49.2.3 `#define LVSTATUS_AVISAVER_TOO_MANY_INSTANCES`

Too many concurrent instances of the AviSaver class.

Definition at line 38 of file sv.synview.status.h.

5.49.2.4 `#define LVSTATUS_BUFFER_IS_QUEUED`

The operation on the buffer is not possible, the buffer is queued for acquisition.

Definition at line 230 of file sv.synview.status.h.

5.49.2.5 `#define LVSTATUS_BUFFER_NOT_FILLED`

The buffer was not yet filled with image data.

Definition at line 233 of file sv.synview.status.h.

5.49.2.6 `#define LVSTATUS_CANNOT_LOAD_GENTL`

The GenTL library cannot be loaded. Check its name specification and compatibility.

Definition at line 45 of file sv.synview.status.h.

5.49.2.7 `#define LVSTATUS_CANNOT_LOAD_XML`

The XML file with feature definitions could not be loaded. This may indicate a misconfiguration of the SynView system - reinstallation recommended.

Definition at line 180 of file sv.synview.status.h.

5.49.2.8 `#define LVSTATUS_CANNOT_REOPEN_LIBRARY`

The SynView library cannot be reopened after it was once closed.

Definition at line 236 of file sv.synview.status.h.

5.49.2.9 `#define LVSTATUS_CHUNK_ADAPTER_NOT_AVAILABLE`

The chunk data cannot be parsed, because the ChunkAdapter could not be obtained.

Definition at line 88 of file sv.synview.status.h.

5.49.2.10 `#define LVSTATUS_DEVICE_NOT_ACCESSIBLE`

The device is not accessible. It is either used by other application or, if it is a GigE device, it can be on a different network or there can be an IP address conflict.

Definition at line 155 of file sv.synview.status.h.

5.49.2.11 #define LVSTATUS_DEVICE_NOT_READWRITE

The device (camera) does not permit a read-write access. The application attempted to open the device for controllable or exclusive access, but it is probably currently used by another application.

Definition at line 160 of file sv.synview.status.h.

5.49.2.12 #define LVSTATUS_DEVICE_TOO_MANY_INSTANCES

Too many concurrent instances of the Device class.

Definition at line 41 of file sv.synview.status.h.

5.49.2.13 #define LVSTATUS_DISABLED_BY_CALLBACK

This function is disabled, because the callback function was registered.

Definition at line 48 of file sv.synview.status.h.

5.49.2.14 #define LVSTATUS_DISPLAY_CANNOT_DISPLAY

The buffer contents cannot be displayed, either because its pixel format cannot be converted to a displayable one, or the display options are not supported by the operating system.

Definition at line 57 of file sv.synview.status.h.

5.49.2.15 #define LVSTATUS_DISPLAY_LIBRARY_NOT_LOADED

The lv.display library is not loaded. Failure to load this library may be caused by the operating system environment.

Definition at line 52 of file sv.synview.status.h.

5.49.2.16 #define LVSTATUS_DISPLAY_NOT_OPEN

The display is not open - an invalid window handle (and/or in Linux display pointer) was set.

Definition at line 61 of file sv.synview.status.h.

5.49.2.17 #define LVSTATUS_ENUM_ENTRY_INVALID

The requested enum entry name or value does not exist.

Definition at line 64 of file sv.synview.status.h.

5.49.2.18 #define LVSTATUS_ENUM_ENTRY_NOT_AVAILABLE

The requested enumeration entry is not available.

Definition at line 196 of file sv.synview.status.h.

5.49.2.19 #define LVSTATUS_ERROR

Undefined error. More info in the sv.synview.log file.

Definition at line 353 of file sv.synview.status.h.

5.49.2.20 #define LVSTATUS_EVENT_NOT_POSSIBLE

The requested functionality cannot be used for this Event type.

Definition at line 67 of file sv.synview.status.h.

5.49.2.21 #define LVSTATUS_EVENT_TOO_MANY_INSTANCES

Too many concurrent instances of the Event class.

Definition at line 70 of file sv.synview.status.h.

5.49.2.22 #define LVSTATUS_FILE_CANNOT_CREATE

Cannot create file. Might be caused by a wrong path specification, insufficient rights or protected file existence.

Definition at line 74 of file sv.synview.status.h.

5.49.2.23 #define LVSTATUS_FILE_CANNOT_OPEN

Cannot open file. Might be caused by a wrong path specification, insufficient rights or file nonexistence.

Definition at line 78 of file sv.synview.status.h.

5.49.2.24 #define LVSTATUS_GC_ABORT

The GenTL library returned the GC_ERR_ABORT error. More info in the sv.synview.log file.

Definition at line 289 of file sv.synview.status.h.

5.49.2.25 #define LVSTATUS_GC_ACCESS_DENIED

The GenTL library returned the GC_ERR_ACCESS_DENIED error. More info in the sv.synview.log file.

Definition at line 261 of file sv.synview.status.h.

5.49.2.26 #define LVSTATUS_GC_BUFFER_TOO_SMALL

The GenTL library returned the GC_ERR_BUFFER_TOO_SMALL error. More info in the sv.synview.log file.

Definition at line 305 of file sv.synview.status.h.

5.49.2.27 #define LVSTATUS_GC_BUSY

The GenTL library returned the GC_ERR_BUSY error. More info in the sv.synview.log file.

Definition at line 329 of file sv.synview.status.h.

5.49.2.28 #define LVSTATUS_GC_CUSTOM_ID

The GenTL library returned the GC_ERR_CUSTOM_ID error. More info in the sv.synview.log file.

Definition at line 333 of file sv.synview.status.h.

5.49.2.29 #define LVSTATUS_GC_ERROR

The GenTL library returned the GC_ERR_ERROR error. More info in the sv.synview.log file.

Definition at line 245 of file sv.synview.status.h.

5.49.2.30 #define LVSTATUS_GC_GIGEVERSION_NOT_SUPPORTED

The GenTL library returned the LVSTATUS_GC_GIGEVERSION_NOT_SUPPORTED error. More info in the sv.↔
synview.log file.

Definition at line 336 of file sv.synview.status.h.

5.49.2.31 #define LVSTATUS_GC_INVALID_ADDRESS

The GenTL library returned the GC_ERR_INVALID_ADDRESS error. More info in the sv.synview.log file.

Definition at line 301 of file sv.synview.status.h.

5.49.2.32 #define LVSTATUS_GC_INVALID_BUFFER

The GenTL library returned the GC_ERR_INVALID_BUFFER error. More info in the sv.synview.log file.

Definition at line 293 of file sv.synview.status.h.

5.49.2.33 #define LVSTATUS_GC_INVALID_HANDLE

The GenTL library returned the GC_ERR_INVALID_HANDLE error. More info in the sv.synview.log file.

Definition at line 265 of file sv.synview.status.h.

5.49.2.34 #define LVSTATUS_GC_INVALID_ID

The GenTL library returned the GC_ERR_INVALID_ID error. More info in the sv.synview.log file.

Definition at line 269 of file sv.synview.status.h.

5.49.2.35 #define LVSTATUS_GC_INVALID_INDEX

The GenTL library returned the GC_ERR_INVALID_INDEX error. More info in the sv.synview.log file.

Definition at line 309 of file sv.synview.status.h.

5.49.2.36 #define LVSTATUS_GC_INVALID_PARAMETER

The GenTL library returned the GC_ERR_INVALID_PARAMETER error. More info in the sv.synview.log file.

Definition at line 277 of file sv.synview.status.h.

5.49.2.37 #define LVSTATUS_GC_INVALID_VALUE

The GenTL library returned the GC_ERR_INVALID_VALUE error. More info in the sv.synview.log file.

Definition at line 317 of file sv.synview.status.h.

5.49.2.38 `#define LVSTATUS_GC_IO`

The GenTL library returned the `GC_ERR_IO` error. More info in the `sv.synview.log` file.

Definition at line 281 of file `sv.synview.status.h`.

5.49.2.39 `#define LVSTATUS_GC_NO_DATA`

The GenTL library returned the `GC_ERR_NO_DATA` error. More info in the `sv.synview.log` file.

Definition at line 273 of file `sv.synview.status.h`.

5.49.2.40 `#define LVSTATUS_GC_NOT_AVAILABLE`

The GenTL library returned the `GC_ERR_NOT_AVAILABLE` error. More info in the `sv.synview.log` file.

Definition at line 297 of file `sv.synview.status.h`.

5.49.2.41 `#define LVSTATUS_GC_NOT_IMPLEMENTED`

The GenTL library returned the `GC_ERR_NOT_IMPLEMENTED` error. More info in the `sv.synview.log` file.

Definition at line 253 of file `sv.synview.status.h`.

5.49.2.42 `#define LVSTATUS_GC_NOT_INITIALIZED`

The GenTL library returned the `GC_ERR_NOT_INITIALIZED` error. More info in the `sv.synview.log` file.

Definition at line 249 of file `sv.synview.status.h`.

5.49.2.43 `#define LVSTATUS_GC_OUT_OF_MEMORY`

The GenTL library returned the `GC_ERR_OUT_OF_MEMORY` error. More info in the `sv.synview.log` file.

Definition at line 325 of file `sv.synview.status.h`.

5.49.2.44 `#define LVSTATUS_GC_PARSING_CHUNK_DATA`

The GenTL library returned the `GC_ERR_PARSING_CHUNK_DATA` error. More info in the `sv.synview.log` file.

Definition at line 313 of file `sv.synview.status.h`.

5.49.2.45 `#define LVSTATUS_GC_RESOURCE_EXHAUSTED`

The GenTL library returned the `GC_ERR_RESOURCE_EXHAUSTED` error. More info in the `sv.synview.log` file.

Definition at line 321 of file `sv.synview.status.h`.

5.49.2.46 `#define LVSTATUS_GC_RESOURCE_IN_USE`

The GenTL library returned the `GC_ERR_RESOURCE_IN_USE` error. More info in the `sv.synview.log` file.

Definition at line 257 of file `sv.synview.status.h`.

5.49.2.47 #define LVSTATUS_GC_TIMEOUT

The GenTL library returned the GC_ERR_TIMEOUT error. More info in the sv.synview.log file.

Definition at line 285 of file sv.synview.status.h.

5.49.2.48 #define LVSTATUS_GC_UNKNOWN

The GenTL library returned the GC_ERR_UNKNOWN error. More info in the sv.synview.log file.

Definition at line 241 of file sv.synview.status.h.

5.49.2.49 #define LVSTATUS_GENICAM_EXCEPTION

An exception occurred when using the GenICam GenApi library. More info about the exception nature is recorded to the sv.synview.log file.

Definition at line 82 of file sv.synview.status.h.

5.49.2.50 #define LVSTATUS_HANDLE_INVALID

An invalid handle was passed to a SynView API function.

Definition at line 85 of file sv.synview.status.h.

5.49.2.51 #define LVSTATUS_INDEX_OUT_OF_RANGE

The specified index is out of range.

Definition at line 91 of file sv.synview.status.h.

5.49.2.52 #define LVSTATUS_INSUFFICIENT_BUFFER_SIZE

Some of the allocated buffers are of smaller size, than is the payload size needed for the acquisition. See also [LvStream_LvCalcPayloadSize](#).

Definition at line 171 of file sv.synview.status.h.

5.49.2.53 #define LVSTATUS_INSUFFICIENT_STRING_BUFFER_SIZE

The string buffer passed to the function does not have the size big enough to hold the returned string.

Definition at line 184 of file sv.synview.status.h.

5.49.2.54 #define LVSTATUS_INTERFACE_TOO_MANY_INSTANCES

Too many concurrent instances of the Interface class.

Definition at line 94 of file sv.synview.status.h.

5.49.2.55 #define LVSTATUS_INVALID_ENUMENTRY_ID

The specified enum entry ID is not a valid SynView constant. Use the enum entry string identifiers to handle enum entries which do not have a SynView constant defined.

Definition at line 111 of file sv.synview.status.h.

5.49.2.56 #define LVSTATUS_INVALID_IN_THIS_MODULE

This function cannot be used in this module.

Definition at line 97 of file sv.synview.status.h.

5.49.2.57 #define LVSTATUS_INVALID_IP_OR_MAC_ADDRESS_FORMAT

The IP or MAC Address used in the [LvSetString\(\)](#) has wrong format. The proper format is N.N.N.N for IP address and XX:XX:XX:XX:XX:XX for MAC address, where N is decadic number between 0 and 255, XX is 2 digit hexadecimal number.

Definition at line 176 of file sv.synview.status.h.

5.49.2.58 #define LVSTATUS_ITEM_GROUP_INVALID

Invalid FtrGroup specified.

Definition at line 100 of file sv.synview.status.h.

5.49.2.59 #define LVSTATUS_ITEM_INVALID

Invalid Item ID specified.

Definition at line 103 of file sv.synview.status.h.

5.49.2.60 #define LVSTATUS_ITEM_NOT_APPLICABLE

This function is not applicable to this item.

Definition at line 114 of file sv.synview.status.h.

5.49.2.61 #define LVSTATUS_ITEM_NOT_AVAILABLE

This function requires availability of specific item, but it is not available. More info in the sv.synview.log file.

Definition at line 118 of file sv.synview.status.h.

5.49.2.62 #define LVSTATUS_ITEM_NOT_READABLE

The item is not readable.

Definition at line 121 of file sv.synview.status.h.

5.49.2.63 #define LVSTATUS_ITEM_NOT_WRITABLE

The item is not writable.

Definition at line 124 of file sv.synview.status.h.

5.49.2.64 #define LVSTATUS_LAST_ERROR_NOT_AVAILABLE

The last error status could not be recorded. This is most probably caused by too many threads used by the application.

Definition at line 350 of file sv.synview.status.h.

5.49.2.65 #define LVSTATUS_LIBRARY_NOT_LOADED

The base library is not loaded. Failure to load the library may be caused by missing DLLs, check the SynView installation.

Definition at line 32 of file sv.synview.status.h.

5.49.2.66 #define LVSTATUS_LIBRARY_NOT_OPEN

The SynView library was not open by the [LvOpenLibrary\(\)](#) function.

Definition at line 35 of file sv.synview.status.h.

5.49.2.67 #define LVSTATUS_LICENSE_NOT_AVAILABLE

License error. License not available

Definition at line 346 of file sv.synview.status.h.

5.49.2.68 #define LVSTATUS_LUT_NOT_AVAILABLE

The lookup table is not available for the current pixel format.

Definition at line 202 of file sv.synview.status.h.

5.49.2.69 #define LVSTATUS_LUT_UNSUPPORTED_SIZE

The lookup table has unsupported size.

Definition at line 205 of file sv.synview.status.h.

5.49.2.70 #define LVSTATUS_NO_CONSTANT_FOR_THIS_ENUMENTRY

SynView constant does not exists for this enum entry. Use the enum entry string identifier to handle it.

Definition at line 107 of file sv.synview.status.h.

5.49.2.71 #define LVSTATUS_NODE_MAP_CANNOT_GET

Cannot obtain a feature node map for the device. More info in the sv.synview.log file.

Definition at line 128 of file sv.synview.status.h.

5.49.2.72 #define LVSTATUS_NOT_ENOUGH_BUFFERS

The number of allocated buffers is smaller than required minimum number of buffers. See also the [LvStream_↔StreamAnnounceBufferMinimum](#).

Definition at line 167 of file sv.synview.status.h.

5.49.2.73 #define LVSTATUS_NOT_FOUND

The Interface or Device was not found according to the search criteria.

Definition at line 187 of file sv.synview.status.h.

5.49.2.74 #define LVSTATUS_NOT_IMPLEMENTED

The functionality is not implemented for the requested parameters.

Definition at line 131 of file sv.synview.status.h.

5.49.2.75 #define LVSTATUS_NOT_SUPPORTED_FOR_THIS_EVENT

The requested function is not supported by this event type.

Definition at line 163 of file sv.synview.status.h.

5.49.2.76 #define LVSTATUS_OK

No error.

Definition at line 28 of file sv.synview.status.h.

5.49.2.77 #define LVSTATUS_PARAM_NOT_APPLICABLE

A parameter passed to the function is not applicable at this function. For example in the [LvSystemFindInterface\(\)](#) the constant `LvFindBy_UserID` is not applicable, because this constant can be used only for devices.

Definition at line 193 of file sv.synview.status.h.

5.49.2.78 #define LVSTATUS_PARAMETER_INVALID

Invalid parameter passed to a SynView API function (for example an invalid pointer).

Definition at line 135 of file sv.synview.status.h.

5.49.2.79 #define LVSTATUS_RENDERER_TOO_MANY_INSTANCES

Too many concurrent instances of the Renderer class.

Definition at line 138 of file sv.synview.status.h.

5.49.2.80 #define LVSTATUS_SETTINGS_INCOMPATIBLE_ID

The file with settings were saved with an ID. The ID specified when loading is different.

Definition at line 227 of file sv.synview.status.h.

5.49.2.81 #define LVSTATUS_SETTINGS_INCOMPATIBLE_MODEL

The file with settings was created by different remote device vendor/model. This may cause its incompatibility with the current remote device.

Definition at line 220 of file sv.synview.status.h.

5.49.2.82 #define LVSTATUS_SETTINGS_INCOMPATIBLE_VERSION

The file with settings was created by different remote device firmware version. This may cause its incompatibility with the current remote device.

Definition at line 224 of file sv.synview.status.h.

5.49.2.83 #define LVSTATUS_SRCGEN_SYMBOLIC_NOT_AVAILABLE

The symbolic for requested item is not available.

Definition at line 343 of file sv.synview.status.h.

5.49.2.84 #define LVSTATUS_SRCGEN_TEMPLATE_NOT_AVAILABLE

The template for requested item is not available.

Definition at line 340 of file sv.synview.status.h.

5.49.2.85 #define LVSTATUS_STREAM_ALREADY_STARTED

The stream was already started.

Definition at line 141 of file sv.synview.status.h.

5.49.2.86 #define LVSTATUS_STREAM_ALREADY_STOPPED

The stream was already stopped.

Definition at line 144 of file sv.synview.status.h.

5.49.2.87 #define LVSTATUS_STREAM_TOO_MANY_INSTANCES

Too many concurrent instances of the Stream class.

Definition at line 147 of file sv.synview.status.h.

5.49.2.88 #define LVSTATUS_SYSTEM_TOO_MANY_INSTANCES

Too many concurrent instances of the System class.

Definition at line 150 of file sv.synview.status.h.

5.49.2.89 #define LVSTATUS_TIMEOUT

The function has returned because a timeout has expired.

Definition at line 199 of file sv.synview.status.h.

5.49.2.90 #define LVSTATUS_XML_UNZIP_ERROR

The XML file with camera remote features could not be extracted from the ZIP file.

Definition at line 208 of file sv.synview.status.h.

5.49.3 Typedef Documentation

5.49.3.1 typedef uint32_t LvStatus

General typedef for the error status. Status values are available as defines prefixed with LVSTATUS_xxx. Value of 0 (LVSTATUS_OK) indicates no error. Most SynView functions are returning the status value to indicate the success of the function call. See also the [LvGetErrorMessage\(\)](#) function.

Definition at line 14 of file sv.synview.status.h.

5.50.1 Detailed Description

5.50.2 Macro Definition Documentation

5.50.2.1 `#define LVSTATUS_LVIP_BMP_CONTENTS_INVALID`

The contents of the BMP file is in the invalid or in the unsupported form. You are trying to read a BMP file which has different (or invalid) format than which is supported by this library.

Definition at line 560 of file `sv.synview.status.h`.

5.50.2.2 #define LVSTATUS_LVIP_BMP_INCOMPATIBLE_LINE_INCREMENT

Color format has incompatible line increment to BMP possibilities. The BMP has to have line increment aligned to 4 bytes.

Definition at line 429 of file sv.synview.status.h.

5.50.2.3 #define LVSTATUS_LVIP_BMP_INCOMPATIBLE_PIXEL_FORMAT

Source pixel format is incompatible to BITMAP pixel format possibilities. BITMAP could be created only using one of these pixel formats:

```
1 LVIP_PIXEL_FORMAT_MONO8
2 LVIP_PIXEL_FORMAT_RGB555_PACKED
3 LVIP_PIXEL_FORMAT_RGB565_PACKED
4 LVIP_PIXEL_FORMAT_RGB8_PACKED
5 LVIP_PIXEL_FORMAT_RGBA8_PACKED
```

If you have the image in other pixel format, you should convert the image by the `LVIP_ConvertToPixelFormat()` function.

Definition at line 425 of file sv.synview.status.h.

5.50.2.4 #define LVSTATUS_LVIP_CANNOT_CREATE_WRITE_FILE

A system error occurred when trying to create or write to the file. Possible reasons could be an invalid path and/or file name, without rights to be created/written.

Definition at line 551 of file sv.synview.status.h.

5.50.2.5 #define LVSTATUS_LVIP_CANNOT_OPEN_READ_FILE

A system error occurred when trying to open or read the file. Possible reasons could be a wrong path and/or file name, the file currently locked or without rights to be opened/read or the file does not exist yet.

Definition at line 547 of file sv.synview.status.h.

5.50.2.6 #define LVSTATUS_LVIP_DST_IMAGEINFO_NO_DATA

The destination image info structure has no data. The destination image info has no image data - it means that the destination image info does not point to any valid image data and it is not permitted to allocate the buffer automatically (the [LvipOption_ReallocateDst](#) flag was not specified).

Definition at line 509 of file sv.synview.status.h.

5.50.2.7 #define LVSTATUS_LVIP_DST_IMG_INFO_INCOMPATIBLE

Destination image info is incompatible to expected output format. You are trying to call a function and the supplied destination image info has other than expected contents.

Possible reason is that you don't specify the [LvipOption_ReallocateDst](#) flag, so if the function has different output format than specified in the destination image info, the image info could not be relocated and this error happens.

Note that some functions may require different destination parameters than expected, the size of the destination image in the `LVIP_CopyArea()` function depends on whether the desired rectangle lies fully in the image or not.

Definition at line 470 of file sv.synview.status.h.

5.50.2.8 #define LVSTATUS_LVIP_DST_RECT_OUTSIDE_SRC

The specified rectangle is outside of source image data. It means that you are trying to copy an area which not exist in the source image. To create a destination image, the rectangle must at least partially overlap the source image.

Definition at line 497 of file sv.synview.status.h.

5.50.2.9 #define LVSTATUS_LVIP_IMAGEINFO_NOT_EQUAL

Image info not equal.

Definition at line 432 of file sv.synview.status.h.

5.50.2.10 #define LVSTATUS_LVIP_IMAGEINFO_NOT_INITIALIZED

The [LvIpImgInfo](#) parameter is not initialized. The supplied [LvIpImgInfo](#) parameter has invalid contents. Either initialize it with the [LVIP_InitImgInfo\(\)](#) function or setup in your code all the members to appropriate values.

Definition at line 397 of file sv.synview.status.h.

5.50.2.11 #define LVSTATUS_LVIP_INCOMPATIBLE_REF_FLAGS

The reference image has incompatible flags. When using the reference image info (in the [LVIP_ApplyShadingCorrection\(\)](#) function), it must have compatible flags as the source image. For example: [LvIpImgAttr_BottomUp](#) flags must be same.

Definition at line 542 of file sv.synview.status.h.

5.50.2.12 #define LVSTATUS_LVIP_INCOMPATIBLE_REF_PIXEL_FORMAT

The reference image is in incompatible pixel format. When using the reference image info (in the [LVIP_ApplyShadingCorrection\(\)](#) function), it must be in the same pixel format as the source image.

Definition at line 536 of file sv.synview.status.h.

5.50.2.13 #define LVSTATUS_LVIP_INCOMPATIBLE_SRC_AND_DST_FLAGS

Source and destination image info have incompatible flags. Some functions need to have both of source and destination image info flags compatible. This applies for example for the bitmap orientation (top-down versus bottom-up).

Definition at line 492 of file sv.synview.status.h.

5.50.2.14 #define LVSTATUS_LVIP_INCOMPATIBLE_SRC_AND_DST_PIXEL_FORMAT

The source and destination image info have different pixel format. You are trying to call some function which expects that both of source and destination image info has the same pixel format. But the destination image info has different pixel format set and it is not permitted to change this (by the [LvIpOption_ReallocateDst](#) flag).

Definition at line 487 of file sv.synview.status.h.

5.50.2.15 #define LVSTATUS_LVIP_INCOMPATIBLE_SRC_AND_DST_SIZE

Destination image info size is different from the source image info size. It means that the function expects that the source and destination image info size is the same. Because it is not, and the destination image info cannot be changed using the [LvIpOption_ReallocateDst](#) flag, this error happens.

Definition at line 475 of file sv.synview.status.h.

5.50.2.16 #define LVSTATUS_LVIP_INCOMPATIBLE_SRC_AND_DST_SIZE_ROTATED

Rotated destination image info size is different to the expected size. It means that the function expects that the source width of image info has to be the same to the height of the destination image info (and vice versa) - and it is not - and additionally destination image info cannot be changed using the [LvipOption_ReallocateDst](#) flag.

Definition at line 481 of file sv.synview.status.h.

5.50.2.17 #define LVSTATUS_LVIP_INVALID_DST_POINTER

Pointer to the destination data image info or its data is invalid.

Definition at line 378 of file sv.synview.status.h.

5.50.2.18 #define LVSTATUS_LVIP_INVALID_LUT_HANDLE

Invalid LUT handle passed as a parameter of the function. The LUT is in incompatible format which couldn't be used in this function.

General this happens when trying to use some Bayer-decoding function and a non-Bayer LUT is used or the LUT has been created for the different pixel format.

Definition at line 524 of file sv.synview.status.h.

5.50.2.19 #define LVSTATUS_LVIP_INVALID_LUT_TYPE

Invalid LUT type passed as a parameter of the function. The LUT is in incompatible format which couldn't be used in this function.

General this happens when trying to use some Bayer-decoding function and a non-Bayer LUT is used or the LUT has been created for the different pixel format.

Definition at line 531 of file sv.synview.status.h.

5.50.2.20 #define LVSTATUS_LVIP_INVALID_PIXEL_FORMAT

The source or destination image info has invalid or unexpected pixel format or the `dwPixelIncrement` value in the of [LviplmgInfo](#) structure. Another reason when this error code could be retrieved is when using the `LVIP_Bmp↔InfoToImgInfo()` function with `BITMAPINFOHEADER` containing in its `biBitCount` member a different value than is supported. Supported values in `BITMAPINFOHEADER` are:

```
1 8          LVIP_PIXEL_FORMAT_MONO8
2 16         LVIP_PIXEL_FORMAT_RGB555_PACKED or LVIP_PIXEL_FORMAT_RGB565_PACKED
3           (depends on biCompression member of the BITMAPINFOHEADER)
4 24         LVIP_PIXEL_FORMAT_RGB8_PACKED
5 32         LVIP_PIXEL_FORMAT_RGBA8_PACKED
```

Definition at line 392 of file sv.synview.status.h.

5.50.2.21 #define LVSTATUS_LVIP_INVALID_POINTER

Invalid pointer. One of the pointers used by the function is NULL or invalid.

Definition at line 372 of file sv.synview.status.h.

5.50.2.22 `#define LVSTATUS_LVIP_INVALID_SRC_POINTER`

Pointer to the source data image info or its data is invalid.

Definition at line 375 of file sv.synview.status.h.

5.50.2.23 `#define LVSTATUS_LVIP_JPEG_LOAD_FAILED`

Loading from JPEG failed. More info in the LOG file.

Definition at line 572 of file sv.synview.status.h.

5.50.2.24 `#define LVSTATUS_LVIP_JPEG_SAVE_FAILED`

Saving to JPEG failed. More info in the LOG file.

Definition at line 568 of file sv.synview.status.h.

5.50.2.25 `#define LVSTATUS_LVIP_LINEINCREMENT_TOO_BIG`

Image line increment is too big. This some functions support only limited line increment. This currently applies only to `LVIP_Deinterlace()` function, which has a limit of $2048 * 32\text{bit RGB image}$ - it means that line increment could be more than 8192 bytes.

Definition at line 457 of file sv.synview.status.h.

5.50.2.26 `#define LVSTATUS_LVIP_MEMORY_ALLOC_FAILED`

Memory allocation failed. This error code happens when the operating system does not allow to allocate any new memory to this library. When this error happens, there is a critical insufficiency of memory; it might indicate a huge memory leak, typically caused by not deallocating used images when processing in a loop. Another cause could be big image dimensions resulting in an attempt to allocate a huge memory amount. Typically this error code could be retrieved from `LVIP_AllocateImageData()` or `LVIP_SaveToTiff()` functions.

Definition at line 405 of file sv.synview.status.h.

5.50.2.27 `#define LVSTATUS_LVIP_NOT_BAYER_PIXEL_FORMAT`

The PixelFormat is not BayerArray

Definition at line 564 of file sv.synview.status.h.

5.50.2.28 `#define LVSTATUS_LVIP_NOT_DISPLAYABLE_FORMAT`

The image isn't in the displayable format. If there is a need to display an image, there is a need to have this image in a displayable format (in Windows one of the BMP pixel formats and the line increment aligned to 4 bytes). The image does not have such format and the automatic conversion to a displayable format was not enabled (using the third parameter of the `LVIP_DisplayImage()` function and optionally the [LvipOption_ReallocateDst](#) flag).

Definition at line 517 of file sv.synview.status.h.

5.50.2.29 `#define LVSTATUS_LVIP_SRC_IMAGEINFO_NO_DATA`

The source image info structure has no data. The source image info has no image data - it means that the source image info does not point to any valid image data.

Use `LVIP_AllocateImageData()` function to allocate the buffer for the image or point the `pData` member(s) to a valid image.

Definition at line 504 of file `sv.synview.status.h`.

5.50.2.30 `#define LVSTATUS_LVIP_TIFF_CONTENTS_INVALID`

The contents of the TIFF file is in the invalid or in the unsupported form. You are probably trying to read a TIFF file, which was not created by this library (see the `LVIP_SaveToTiff()` function)

Definition at line 555 of file `sv.synview.status.h`.

5.50.2.31 `#define LVSTATUS_LVIP_UNSUPPORTED`

The requested function or format is not supported. If you are not sure which functionality is not supported, see New Electronic Technology Log Messages Receiver application for details.

Definition at line 437 of file `sv.synview.status.h`.

5.50.2.32 `#define LVSTATUS_LVIP_UNSUPPORTED_BMP_HEADER`

BMP header is unsupported. Some members of `BITMAPINFOHEADER` (part of `BITMAPINFO`) have unexpected or unsupported values. Check if the `BITMAPINFO` has correct data and that is correctly filled up. Members `biSize` and `biCompression` have to be correctly filled up. The `biCompression` member has to be filled up with `BI_RGB` or `BI_BITFIELDS` values.

Definition at line 412 of file `sv.synview.status.h`.

5.50.2.33 `#define LVSTATUS_LVIP_UNSUPPORTED_COLOR_PLANES`

The image uses color planes and the called function doesn't support it.

Definition at line 448 of file `sv.synview.status.h`.

5.50.2.34 `#define LVSTATUS_LVIP_UNSUPPORTED_DST_PIXEL_FORMAT`

Unsupported pixel format of the destination. See documentation of function which returns this error code for supported destination pixel formats.

Definition at line 445 of file `sv.synview.status.h`.

5.50.2.35 `#define LVSTATUS_LVIP_UNSUPPORTED_REVERSION`

The image uses reversion and the called function doesn't support it.

Definition at line 451 of file `sv.synview.status.h`.

5.50.2.36 `#define LVSTATUS_LVIP_UNSUPPORTED_SRC_PIXEL_FORMAT`

Unsupported pixel format of the source. See documentation of the function which returns this error code for supported source pixel formats.

Definition at line 441 of file `sv.synview.status.h`.

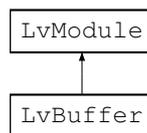

Chapter 6

Class Documentation

6.1 LvBuffer Class Reference

```
#include <sv.synview.class.h>
```

Inheritance diagram for LvBuffer:

Public Member Functions

- [LvStatus AttachProcessBuffer](#) (void *pDataPointer, size_t DataSize)
- [LvStatus Queue](#) ()
- [LvStatus ParseChunkData](#) (bool UpdateLayout=false)

Additional Inherited Members

6.1.1 Detailed Description

The [LvBuffer](#) class.

Note

For all the SynView module classes you cannot use the new and delete operators directly (the constructor and destructor are private). Instead, the static methods for opening and closing the class instance assure that if the opening is successful, you get a valid pointer, otherwise you get a NULL pointer. Also, the closing functions set the pointer back to NULL. Another advantage is that these functions return a status value, which can clarify the error nature, if the opening or closing fails.

Definition at line 2427 of file sv.synview.class.h.

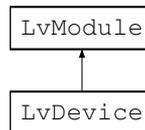

The documentation for this class was generated from the following file:

- include/sv.synview.class.h

6.2 LvDevice Class Reference

```
#include <sv.synview.class.h>
```

Additional Inherited Members

6.3.1 Detailed Description

The [LvEvent](#) class.

Note

For all the SynView module classes you cannot use the new and delete operators directly (the constructor and destructor are private). Instead, the static methods for opening and closing the class instance assure that if the opening is successful, you get a valid pointer, otherwise you get a NULL pointer. Also, the closing functions set the pointer back to NULL. Another advantage is that these functions return a status value, which can clarify the error nature, if the opening or closing fails.

Definition at line 2631 of file sv.synview.class.h.

The documentation for this class was generated from the following file:

- include/sv.synview.class.h

6.4 LvException Class Reference

```
#include <sv.synview.class.h>
```

Public Member Functions

- [LvException](#) (const char *pMessage, [LvStatus Number](#)) throw ()
- [LvException](#) (const [LvException](#) &e) throw ()
- const char * [Message](#) () throw ()
- [LvStatus Number](#) () throw ()

6.4.1 Detailed Description

Undefine LV_USE_STDLIB in case you do not want to use the standard template library. If LV_USE_STDLIB is defined, the functions returning strings are available also overloaded having a std::string& parameter for returning the string.

Define LV_USE_STDEXCEPTION in case you want to use the exception class from the standard library instead of [LvException](#).

Call `LvLibrary::SetThrowErrorEnable(true)` in case you want to use the C++ exceptions of the [LvException](#) type to be thrown when the function returns a status not equal to LVSTATUS_OK. Then you can use the error handling in the form shown in the example below:

```
try
{
    m_pDevice->AcquisitionStart();
    // ... and more SynView API calls, without checking the return value
}
catch (LvException e)
{
    DisplayErrorMsg(e.Message(), e.Number());
    return;
}
```

Definition at line 50 of file sv.synview.class.h.

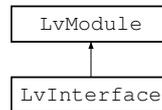

The documentation for this class was generated from the following file:

- include/sv.synview.class.h

6.5 LvInterface Class Reference

```
#include <sv.synview.class.h>
```

Inheritance diagram for LvInterface:

Public Member Functions

- static [LvStatus Open](#) (LvSystem *pSystem, const char *pInterfaceld, LvInterface *&pInterface)
- static [LvStatus Close](#) (LvInterface *&pInterface)

Additional Inherited Members

6.5.1 Detailed Description

The [LvInterface](#) class.

Note

For all the SynView module classes you cannot use the new and delete operators directly (the constructor and destructor are private). Instead, the static methods for opening and closing the class instance assure that if the opening is successful, you get a valid pointer, otherwise you get a NULL pointer. Also, the closing functions set the pointer back to NULL. Another advantage is that these functions return a status value, which can clarify the error nature, if the opening or closing fails.

Definition at line 1592 of file sv.synview.class.h.

The documentation for this class was generated from the following file:

- include/sv.synview.class.h

6.6 LvIplmgInfo Struct Reference

```
#include <sv.synview.defs.h>
```

Public Attributes

- `uint32_t` [StructSize](#)
- `uint32_t` [Width](#)
- `uint32_t` [Height](#)
- `uint32_t` [PixelFormat](#)
- `uint32_t` [Attributes](#)
- `uint32_t` [BytesPerPixel](#)
- `uint32_t` [LinePitch](#)
- `uint8_t *` [pData](#)
- `uint8_t *` [pDataR](#)
- `uint8_t *` [pDataG](#)
- `uint8_t *` [pDataB](#)

6.6.1 Detailed Description

Image Info structure. Each image handled by the library must be described by the [LviplmgInfo](#) structure.

Although you can set the Image Info members directly, it is highly recommended to use the [LvipnItlmgInfo\(\)](#) function for the structure initialization.

Definition at line 343 of file `sv.synview.defs.h`.

6.6.2 Member Data Documentation

6.6.2.1 `uint32_t` [LviplmgInfo::Attributes](#)

Image attributes. OR-ed definitions from [LviplmgAttr](#) definitions.

Definition at line 364 of file `sv.synview.defs.h`.

6.6.2.2 `uint32_t` [LviplmgInfo::BytesPerPixel](#)

Size of one pixel in bytes.

Definition at line 367 of file `sv.synview.defs.h`.

6.6.2.3 `uint32_t` [LviplmgInfo::Height](#)

Height of the image in pixels.

Definition at line 353 of file `sv.synview.defs.h`.

6.6.2.4 `uint32_t` [LviplmgInfo::LinePitch](#)

Size of one line in bytes.

Example:

```
8-bit mono image: LineIncrement = Width;
24-bit RGB image: LineIncrement = Width * 3;
```

However, when the [LviplmgAttr_DWordAligned](#) attribute is used, the line increment must be rounded up to whole double-words, so the calculation would then look like this:

```
8-bit mono image: LineIncrement = (Width+3)/4 * 4;
24-bit RGB image: LineIncrement = ((Width*3)+3)/4 * 4;
```

Definition at line 382 of file `sv.synview.defs.h`.

6.6.2.5 uint8_t* LvipImgInfo::pData

Pointer to image data. If color planes are not used, this member points to the data of the image. Use [LvipAllocateImageData\(\)](#) to allocate the buffer for the image. If you set the pointer to an existing image, which is not owned by this [LvipImgInfo](#), use the [LvipImgAttr_NotDataOwner](#) attribute.

Definition at line 388 of file sv.synview.defs.h.

6.6.2.6 uint8_t* LvipImgInfo::pDataB

If color planes are used, this member points to the Blue plane data of the image. Use [LvipAllocateImageData\(\)](#) to allocate the buffer for the image. If you set the pointer to an existing image, which is not owned by this [LvipImgInfo](#), use the [LvipImgAttr_NotDataOwner](#) attribute.

Definition at line 403 of file sv.synview.defs.h.

6.6.2.7 uint8_t* LvipImgInfo::pDataG

If color planes are used, this member points to the Green plane data of the image. Use [LvipAllocateImageData\(\)](#) to allocate the buffer for the image. If you set the pointer to an existing image, which is not owned by this [LvipImgInfo](#), use the [LvipImgAttr_NotDataOwner](#) attribute.

Definition at line 398 of file sv.synview.defs.h.

6.6.2.8 uint8_t* LvipImgInfo::pDataR

If color planes are used, this member points to the Red plane data of the image. Use [LvipAllocateImageData\(\)](#) to allocate the buffer for the image. If you set the pointer to an existing image, which is not owned by this [LvipImgInfo](#), use the [LvipImgAttr_NotDataOwner](#) attribute.

Definition at line 393 of file sv.synview.defs.h.

6.6.2.9 uint32_t LvipImgInfo::PixelFormat

Pixel format of the image which is saved in this structure. One of the [LvPixelFormat](#)

In case of color planes, the pixel format applies to one plane, so use only the MONO formats for the planes. For example for 3x8-bit RGB use the [LvPixelFormat_Mono8](#) format.

Definition at line 360 of file sv.synview.defs.h.

6.6.2.10 uint32_t LvipImgInfo::StructSize

Size of image info structure. Should be set to the `sizeof(LvipImgInfo)`. This member may be used in the future versions for the compatibility check.

Definition at line 349 of file sv.synview.defs.h.

6.6.2.11 uint32_t LvipImgInfo::Width

Width of the image in pixels.

Definition at line 351 of file sv.synview.defs.h.

The documentation for this struct was generated from the following file:

- include/sv.synview.defs.h

6.7 LvLibrary Class Reference

```
#include <sv.synview.class.h>
```

Protected Attributes

- [LvHModule m_hModule](#)

6.8.1 Detailed Description

The base class for all modules. It provides methods for manipulating the features, if the module provides any. This class cannot be instantiated, it only serves as a base class.

Definition at line 426 of file sv.synview.class.h.

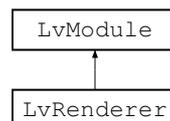

The documentation for this class was generated from the following file:

- include/sv.synview.class.h

6.9 LvRenderer Class Reference

```
#include <sv.synview.class.h>
```

- static [LvStatus Close](#) ([LvRenderer](#) *&pRenderer)

Additional Inherited Members

6.9.1 Detailed Description

The [LvRenderer](#) class.

Note

For all the SynView module classes you cannot use the new and delete operators directly (the constructor and destructor are private). Instead, the static methods for opening and closing the class instance assure that if the opening is successful, you get a valid pointer, otherwise you get a NULL pointer. Also, the closing functions set the pointer back to NULL. Another advantage is that these functions return a status value, which can clarify the error nature, if the opening or closing fails.

Definition at line 2879 of file sv.synview.class.h.

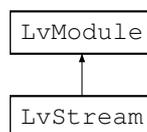

The documentation for this class was generated from the following file:

- include/sv.synview.class.h

6.10 LvStream Class Reference

```
#include <sv.synview.class.h>
